## CONVERTER, TELEGRAPH-TELEPHONE

## SIGNAL CV-425/U

## (PART OF TERMINAL TELEGRAPH-TELEPHONE ANTCC-29)

This copy is a reprint which includes current pages from Change 1.

## WARNING

## HIGH VOLTAGE

is used in the operation of this equipment

## DEATH ON CONTACT

may result if personnel fail to observe safety precautions.
Learn the areas containing high voltage in each piece of equipment.
Be careful not to contact high-voltage connections when installing or operating this equipment.

Before working inside the equipment, turn power off and ground points of high potential before touching them.

2. File this change sheet in the front of the publication for reference purposes.

By Order of the Secretary of the Army:

Official:
JOHN A. WICKHAM JR.
General, United States Army
Chief of Staff

DI STRI BUTI ON:
To be distributed in accordance with DA Form 12-51 literature requi rements for CV-425/ U.

$+$

SAFETY STEPS TO FOLLOW IF SOMEONE IS THE VICTIM OF ELECTRICAL SHOCK

DO NOT TRY TO PULL OR GRAB THE INDIVIDUAL

IF POSSIBLE, TURN OFF THE ELECTRICAL POWER

IF YOU CANNOT TURN OFF THE ELECTRICAL POWER, PULL, PUSH OR LIFT THE PERSON TO SAFETY USING A WOODEN POLE OR A ROPE OR SOME OTHER INSULATING MATERIAL

SEND FOR HELP AS SOON AS POSSIBLE

AFTER THE INJURED PERSON IS FREE OF CONTACT WITH THE SOURCE OF ELECTRICAL SHOCK, MOVE THE PERSON A SHORT DISTANCE AWAY AND IMMEDIATELY START ARTIFICIAL RESUSCITATION

## WARNING

Adequate ventilation should be provided while using TRICHLOROTRIFLUOROETHANE. Prolonged breathing of vapor should be avoided. The solvent should not be used near heat or open flame; the products of decomposition are toxic and irritating. Since TRICHLOROTRIFLUOROETHANE dissolves natural oils, prolonged contact with skin should be avoided. When necessary, use gloves which the solvent cannot penetrate. If the solvent is taken internally, consult a physician immediately.

## CAUTION

$$
\begin{aligned}
& \text { AND ASSEMBLIES SENSITIVE TO } \\
& \text { DAMAGE BY ELECTROSTATIC DISCHARGE (ESD). } \\

## ESD <br> CLASS 1

GENERAL HANDLING PROCEDURES FOR ESDS ITEMS

- USE WRIST GROUND STRAPS OR MANUAL GROUNDING PROCEDURES
- KEEP ESDS ITEMS IN PROTECTIVE

COVERING WHEN NOT IN USE

- GROUND ALL ELECTRICAL TOOLS AND TEST EQUIPMENT
- PERIODICALLY CHECK CONTINUITY AND RESISTANCE OF GROUNDING SYSTEM
- USE ONLY METALIZED SOLDER SUCKERS
- HANDLE ESDS ITEMS ONLY IN PROTECTIVE AREAS

MANUAL GROUNDING PROCEDURES

- MAKE CERTAIN EQUIPMENT IS POWERED DOWN
- TOUCH GROUND PRIOR TO REMOVING ESDS ITEMS
- TOUCH PACKAGE OF REPLACEMENTS ESDS ITEM TO GROUND BEFORE OPENING
- TOUCH GROUND PRIOR TO INSERTING REPLACEMENT ESDS ITEMS

ESD PROTECTIVE PACKAGING AND LABELING

[^0]
## CAUTION

Devices such as CMOS, NMOS, MNOS, VMOS, HMOS, thin-film resistors PMOS, and MOSFET used in many equipments can be damaged by static voltages present in most repair facilities. Most of the components contain internal gate protection circuits that are partially effective, but sound maintenance practice and the cost of equipment failure in time and money dictate careful handling of all electrostatic sensitive components.

The following precautions should be observed when handling all electrostatic sensitive components and units containing such components.

## CAUTION

Failure to observe all of these precautions can cause permanent damage to the electrostatic sensitive device. This damage can cause the device to fail immediately or at a later date when exposed to an adverse environment.

## STEP

Turn off and/or disconnect all power and signal sources and loads used with the unit.

## STEP

2
Place the unit on grounded conductive work surfaces.

## STEP

3 Ground the repair operator using a conductive wrist strap or other device using a 1-M series resistor to protect the operator.

## STEP

7 When not being worked on wrap disconnected circuit boards in aluminum foil or in plastic bags that have been coated or impregnated with a conductive material.

STEP
8 Do not handle these devices unnecessarily or remove from their packages until actually used or tested.

## CHAPTER 1

## INTRODUCTION

## Section I. GENERAL

## 1-1. Scope

This manual covers direct support and general support maintenance for Converter TelegraphTelephone Signal CV-425/U. This section outlines pertinent administrative information. Section II describes purpose, use, and mechanical configuration of the equipment and lists electrical specifications. Chapter 2 provides detailed circuit analysis. Chapters 3 and 4 contain information appropriate to direct support maintenance and general support maintenance respectively.

## 1-2. Consolidated Index of Army Publications and Blank Forms

Refer to the latest issue of DA Pam 310—1 to determine whether there are new editions, changes, or additional publications pertaining to the equipment.

## 1-3. Maintenance Forms, Records, and Reports

a. Reports of Maintenance and Unsatisfactory Equipment. Department of the Army forms and procedures used for equipment maintenance will be those prescribed by DA Pam 738-750, Maintenance Management Update.
b. Report of Packaging and Handling Deficiencies. Fill out and forward SF 364 (Report of Discrepancy (ROD)) as prescribed in AR 735-11-2/DLAR 4140.55/ NAVMATINST 4355.73A/AFR 400-54/MCO 4430.3F.
c. Discrepancy in Shipment Report (DISREP) (SF 361), Fill out and forward Discrepancy in Shipment Report (DISREP) (SF 361) as prescribed in AR 55-38/ NAVSUPINST 4610.33C/AFR 75-18/MCO P4610. 9D/DLAR 4500.15.

## Section II. DESCRIPTION AND DATA

## 1-5. Description

Refer to TM 11-5805-356-12 for purpose, use, and photographs of the equipment.

## 1-4. Reporting Equipment Improvement Recommendations (EIR)

If your equipment needs improvement, let us know. Send us an EIR. You, the user, are the only one who can tell us what you don't like about your equipment. Let us know why you don't like the design. Put it on an SF 368 (Quality Deficiency Report). Mail it to Commander, US Army Communications-Electronics Command and Fort Monmouth, ATTN: AMSEL-ME-MP, Fort Monmouth, New Jersey 07703-5007. We'll send you a reply.

## 1-4.1. Administrative Storage

Administrative storage of equipment issued to and used by Army activities will have preventive maintenance performed in accordance with the PMCS charts before storing. When removing the equipment from administrative storage, the PMCS should be performed to assure operational readiness. Repacking of equipment for shipment or limited storage are covered in SB 38-100.

## 1-4.2. Destruction of Army Electronics Materiel

Destruction of Army electronics materiel to prevent enemy use shall be in accordance with TM 750-244-2.

## 1-4.3. Calibration

Pertinent publications on calibration of this equipment shall be referenced as required.

## 1-6. Tabulated Data

Refer to TM 11-58,05-356-12 for list of technical characteristics of the equipment.

## CHAPTER 2

## FUNCTIONING OF CV-425/U

## Section I. BLOCK DIAGRAM ANALYSIS

## 2-1. General

## fig. 2-1)

$20-\mathrm{Hz}$ ringing signals, used on metallic telephone channels, will not transverse radio-telephone or other carrier telephone channels. For carriertype channels, vf ringing signals are used (1232.5 Hz for vf telegraph applications and 1600 Hz for telephone applications). Where a metallic circuit is connected to a carrier channel, a ringing-signal converting device is required. The CV-425/U converts $20-\mathrm{Hz}$ ringing signals to vf ringing signals and vice versa. The CV-425/U is inserted in the vf signal path between the local
vf circuit and the telephone channel. It monitors the outgoing line for $20-\mathrm{Hz}$ ringing signals and the incoming line for vf ringing signals. While it is detecting a $20-\mathrm{Hz}$ ringing signal, the $\mathrm{CV}-$ $425 / \mathrm{U}$ injects a vf ringing signal into the outgoing telephone channel. While detecting a vf ringing signals, the $\mathrm{CV}-425 / \mathrm{U}$ injects a $20-\mathrm{Hz}$ ringing signal into the incoming vf circuit. Figure 2-1 shows the basic configuration for 4and 2-wire interfacing. Paragraph 2-2 provides a detailed block diagram analysis. Section II describes various circuit stages on a schematic diagram basis.

A. 4-WIRE CONFIGURATION

B. 2-WIRE CONFIGURATION

Figure 2-1. Converter, Telegraph-Telephone Signal CV-425/U, simplified block diagram.

Figure 2-2. Converter, Telegraph-Telephone Signal
$C V-425 / U$, detailed block diagram.

## 2-2. Detailed Block Diagram

 fig. 2-2)a. 20 Hz to Vf Circuit.
(1) 4-wire operation. With $2 \mathrm{~W}-4 \mathrm{~W}$ switch S1 set to 4W for 4-wire operations, the outgoing vf telegraph or telephone signal couples from the local vf circuit through 4WS binding posts E7E8, S1-7-9 and S1-4-6, K1-4-6 and K1-1-5, and 2W-4WS binding posts El-E2 to the telephone channel. When a $20-\mathrm{Hz}$ ringing signal occurs, ring detector A2CR1-CR4 rectifies it to produce a dc voltage that energizes relay K 1 . When K1 is energized it connects output transformer A2T1 to the outgoing channel via K1-7-6 and K1-8-5. The vf signal generated by oscillator A2Q1 then couples through emitter follower A2Q2, A2T1, and K1 to the outgoing channel. The frequency of the vf ringing signal produced by oscillator A2Q1 may be selected by the TG-TP switch. The TG (telegraph) position selects 1232.5 Hz and the TP (telephone) position selects 1600 Hz.
(2) 2-wire operation. With $2 \mathrm{~W}-4 \mathrm{~W}$ switch S1 set to 2 W for 2 -wire operation, the circuit function is the same except the outgoing vf signal couples from the local vf circuit through 2 W 4WR binding posts E5-E6, K2-6-4, and K2-5-1, S1-1-2 and S1-10-11, and K1-1-5 and K1-4-6 to $2 \mathrm{~W}-4 \mathrm{WS}$ binding posts E1-E2.
b. Vf to 20-HZ circuit.
(1) 4-wire operation. With $2 \mathrm{~W}-4 \mathrm{~W}$ switch S1 set to 4 W for 4 -wire operation, the incoming vf ringing signal couples from the telephone channel through 4WR binding posts E3-E4, Sl-$3-1$ and S1-12-10, K2-4-6 and K2-1-5, and $2 \mathrm{~W}-4 \mathrm{WR}$ binding posts E5-E6 to the local vf circuit. The incoming signal also couples through input transformer A1T1, limiter A1Q1-Q2, and discriminator driver A1Q3 to discriminator Z 2 . When a vf ringing signal occurs, Z 2 detects it and responds by applying a dc level through differential amplifier A1Q4-Q5 to energize relay K2. When energized, K2 connects the $20-\mathrm{Hz} 180 \mathrm{v}$ output of the 20 -cycle ringer to binding posts E5-E6 via K2-8-5 and K2-7-6.
(2) 2-wire operation. With $2 \mathrm{~W}-4 \mathrm{~W}$ switch S1 set to 2 W for 2 -wire operation, the circuit function is the same except the incoming vf signal couples from the telephone channel through 2W-4WS binding posts E1-E2, K1-6-4 and K1-$5-1, \mathrm{~S} 1-2-1$ and S1-11-10, K2-4-6 and K2-1-5, and $2 \mathrm{~W}-4 \mathrm{WR}$ binding posts E5-E6 to the local vf circuit.
c. Power Supply. The CV-425/U contains an internal power supply that converts 115 vac or 230 vac to -18 vdc to operate the active circuits and relays.

## Section II. SCHEMATIC DIAGRAM ANALYSIS

## 2-3. VF to $20-\mathrm{Hz}$ Circuits

fig. FO-1.1 or -1.2)
a. 20-Cycle Ringer. This circuit, which produces the $20-\mathrm{Hz}$ ringing signal for application to the loop, is a sealed unit that constantly generates a $20-\mathrm{Hz}$ signal. The signal is coupled to the loop, however, only when K 2 is operated. The ringer output signal is 180 volts, $\pm 10$ percent, peak-to-peak at $20-\mathrm{Hz}$, when operating into a normal telegraph or telephone line impedance.

## b. Limiter A1Q1-A1Q2,

(1) The vf input signal is applied through resistors A1R1 and A1R2 and capacitors A1C1 and A 1 C 2 to the primary winding of input transformer A1T1. Transformer A1T1 couples the line to the receive circuits and maintains a highbridging input impedance. Resistors AlR1, AlR2, and A1R3 enable the transformer to present the required high impedance $(8,000$ ohms) to the line.
(2) The signal across the secondary of
transformer A1T1 is coupled through capacitor A1C4 to the base of transistor A1Q1. This transistor, together with transistor A1Q2, forms a limiter-amplifier. When the applied input signal is large, it is clipped on one-half cycle by transistor A1Q1 and on the other half cycle by diode A1CR1. The clipped signal is then direct-coupled to transistor A1Q2, where additional amplification takes place, producing an output at the collector of transistor A1Q2. Small-amplitude signals are linearly amplified by A1Q1, then further amplified and clipped by transistor A1Q2. A degenerative feedback voltage from transistor A1Q2 is developed across resistor A1R11 and fed back through resistor AlR5 to the base of transistor A1Q1. This feedback stabilizes the amplifier gain against temperature effects and differences in transistor characteristics.

Figures FO-1.1 and FO-1.2, Converter,
Telegraph-Telephone Signal CV-425/U, Schematics.
(Located in back of manual.)
(3) Resistors R1 and R2, capacitor C2, and SENSITIVITY switch S3 provide two levels of input sensitivity for the receive circuits by changing the degeneration produced in the emitter circuit of Q1, When switch S3 is at HIGH, resistors R1 and R2 are bypassed by capacitor C2. When switch S3 is at LOW, only resistor R2 is bypassed, providing negative feedback to reduce the gain, thereby reducing the sensitivity.
(4) Resistor A1R8 is the collector load for transistor A1Q1. Resistors A1R4 and A1R6, with capacitor A1C3, provide bias and decoupling at the base of transistor A1Q1. Capacitor A1C5 prevents oscillation by reducing the amplifier gain at high frequencies. Resistor R9, across which the limiter output is developed, is the collector load for transistor A1Q2.
c. Discriminator Driver A1Q3. This circuit amplifies the vf input and applies it to the discriminator transformer. The input signal is coupled through capacitor A1C7 and current-limiting resistor A1R12, and then developed across base bias resistor A1R13. The voltage across resistor A1R13 is applied to transistor A1Q3 where it is amplified and developed across the primary windings of discriminator transformer Z2. The primary of transformer Z2 resonates at two frequencies, which are selected by switch S2. Resistor AIR14 limits emitter current in the driver.

## d. Discriminator Transformer Z2.

(1) Discriminator transformer Z 2 is an assembly containing two magnetically isolated transformers having tuned transformer primaries series-connected to the driving signal developed by discriminator driver A1Q3. The primary of the upper transformer shown on the schematic diagram is tuned to a higher frequency than the primary of the lower transformer. When TP-TG switch S 2 is set to TP, an internal capacitor resonates the primary winding between terminals 6 and 8 to $1,900 \mathrm{~Hz}$ and another internal capacitor resonates the primary winding between terminals 1 and 3 to $1,600 \mathrm{~Hz}$, this latter frequency corresponding to the telephone ringing frequency. When the TP-TG switch is operated to TG, additional windings on the primary are connected into the circuit, increasing the inductance and lowering the resonant frequency. For this position of the switch, the winding between terminals 5 and 8 is connected across the one internal capacitor to resonate that transformer primary at $1,317 \mathrm{~Hz}$ (corresponding to the mark
vf frequency); the winding between terminals 1 and 4 is connected across the other internal capacitor to resonate that transformer primary at $1,232 \mathrm{~Hz}$ (corresponding to the space vf frequency).
(2) With the primaries series-connected, the greater voltage will be developed across the primary whose resonant frequency is closer to that of the incoming vf signal's. When TP-TG switch S 2 is set to TG and a mark is received, the upper transformer primary develops the greater voltage. With a space frequency (corresponding also to the ring signal), the lower transformer primary develops the greater voltage. Similarly. when the switch is operated to TP, the lower primary develops the greater voltage when the ring frequency used for telephone is received.
(3) The voltage across the secondary of either transformer is a function of the primary voltage. Accordingly, with the TP-TG set to TG, the voltage developed between discriminator transformer output terminals 10 and 11 is greater than the voltage developed between output terminals 9 and 11 when a mark frequency is received, and is less than the latter when a space frequency (ring signal) is received. (When the equipment is set up for telephone ringing, the lesser voltage is also developed between terminals 10 and 11 when receiving the ring signal frequency.) The voltages developed across the secondaries are applied to discriminator AlCR2A1CR3.
e. Discriminator AlCR2-41CR3. Discriminator AlCR2-A1CR3 develops a positive dc voltage with respect to ground across resistor AlR15 corresponding to the amplitude of the secondary voltage across terminals 10 and 11 of discriminator transformer Z 2 , and a negative dc voltage with respect to ground across resistor A1R16 corresponding to the amplitude of the secondary voltage across terminals 9 and 11 of the discriminator transformer. The algebraic sum of the two dc voltages is applied to integrator AlCR4A1CR5. Accordingly, when a ring frequency is received, the discriminator output is negative. When a mark frequency is received during telegraph operation, the output of the discriminator is positive. At other times, random vf signals, which will mostly be far removed from the resonant frequencies of the discriminator transformer primaries, will produce a zero dc voltage at the output of the discriminator. Capacitors

A1C8 and AlC9 serve as filters to smooth the dc voltages produced by the discriminator.
f. Integrator. AlCR4-AlCR5. Integrator Al CR4-A1CR5 builds up a negative charge across capacitor A1C10 whenever the output from the discriminator is negative, and discharges the capacitor when the output goes positive. When the discriminator output is negative, which occurs when the vf ring frequency is received, diodes A1CR4-A1CR5 do not conduct and capacitor AlC10 charges to the discriminator output voltage through resistor A1R17. When the output goes positive, the diodes conduct, and capacitor A1C10 discharges. Diode A1CR5 insures that a reverse polarity is never applied to capacitor A1C10. The voltage across the capacitor is applied to the base of A1Q4 of differential amplifier A1Q4-A1Q5.
g. Differential Amplifier A1Q4-A1Q5. In the circuit of differential amplifier A1Q4-A1Q5, the base of transistor A1Q5 is tied to a negative reference voltage, causing the transistor to conduct. The conduction of transistor A1Q5 produces a voltage drop across resistor A1R19 that keeps transistor A1Q4 cut off unless a negative voltage is applied to the base to overcome the cutoff bias. This negative voltage is developed across capacitor A1C10 as the capacitor charges. The capacitor develops sufficient charge to make transistor AlQ4 conduct after a negative output has been developed at the discriminator for approximately 0.5 second. When transistor A1Q4 conducts, relay K2, in the collector circuit of the transistor, is energized, causing the output of the 20 -cycle ringer to be connected to the loop circuit.

## $\mathbf{2 - 4}$. $\mathbf{2 0 - H z}$ to VF Circuits

## fig. FO-1.1 or 1.2)

a. Ring Detector A2CR1-A2CR4. The ring detector consists of a full-wave bridge rectifier. With an ac voltage greater than 50 volts peak-to-peak applied to it, the rectifier produces sufficient dc output (11 volts) to operate K 1 . Only the $20-\mathrm{Hz}$ ring signal from the loop circuit is of sufficient amplitude to cause the relay to operate and apply a VF (TG-TP) signal to the line binding posts (E1-E2).
b. Oscillator A2Q1-A2Q2, Discrete Components fig. FO-1.1]. Oscillator A2Q1-A2Q2 is a modified Colpitts oscillator using two cascaded emitter followers. The oscillator operates at either of two frequencies selected by TP-TG switch S2. When used for telephone ringing, switch S2 is operated to TP and the oscillator generates $1,600 \mathrm{~Hz}$; when used for telegraph ringing, switch S 2 is operated to TG and the
oscillator generates 1232.5 Hz . The change in frequency is accomplished by adding capacitors A2C1, A2C3, A2C5, and A2C6 in parallel with capacitors A2C2, A2C4, A2C7, and A2C8 when switch S2 is operated to TG, lowering the frequency from 1,600 Hz to 1232.5 Hz . When operating at the lower frequency, the Q of the tank circuit is less. To maintain the output of the oscillator at the same level at the lower frequency, resistor R4 in the emitter circuit of transistor A2Q2 is removed when switch S2 is set to TG, increasing the feedback to transistor A2Q1.
c. Oscillator A2A1, Sealed Unit (fig. FO-1.2). The oscillator operates at either of two frequencies selected by TP-TG switch S2. When used for telephone ringing, switch S2 is operated to TP and the oscillator generates $1,600 \mathrm{~Hz}$; when used for telegraph ringing, switch S 2 is operated to TG and the oscillator generates 1232.5 Hz . To maintain the output of the oscillator at the same level at the lower frequency, resistor R4 is removed when switch S 2 is set to TG.
d. Output Transformer A2T1 Circuit. This circuit couples the oscillator output signal through relay K1 contacts to the LINE terminals. The output signal is fed through coupling capacitor A2C11 and developed across a resistive T-network. The output from this network is applied through transformer A2T1 to contacts 7 and 8 of relay K1. When the relay is operated by a $20-\mathrm{Hz}$ ring signal in the loop circuit, the oscillator output is connected to the line.

## 2-5. Power Supply Circuit

(fig. FO-1)
a. Power Transformer T1. Power transformer T1, which steps down the 115 - or 230 -volt input voltage to 56 volts, consists of two primary windings and a secondary winding. For an input voltage of 115 volts, the primary windings are parallel-connected by strapping terminals 1 and 2 and 3 and 4 . For an input voltage of 230 volts, the windings are series-connected by strapping terminals 2 and 3 . The 56 -volt secondary voltage is developed in both cases.
b. Rectifier A2CR5-A2CR6. This circuit rectifies the 56 -volt ac output voltage of transformer T1 to produce a pulsating negative dc voltage that is applied to the input of filter Cl and voltage regulator $\mathrm{Q} 1-\mathrm{A} 2 \mathrm{CR} 7$.
c. Voltage Regulutor Q1-A2CR7. This circuit regulates the output voltage from the rectifier after it has been smoothed through the action of capacitor Cl . The action maintains a constant -18 volts dc for the circuits of the CV-425/U.

The voltage developed across Zener diode A2CR7 is a constant -18 volts with respect to ground. Transistor Q1 is connected as an emitter follower, with the constant voltage maintained by the Zener diode applied to its base. The output voltage taken from the emitter of transistor Q1 follows the constant voltage of -18 volts maintained at the base.

## CHAPTER 3

## DIRECT SUPPORT MAINTENANCE INSTRUCTIONS

## Section I. GENERAL

## 3-1. Scope of Direct Support Maintenance

Direct support maintenance consists of troubleshooting the CV-425/U down to the pc board or a chassis mounted part. The procedures contained herein are not complete in themselves, but supplement the procedures for organizational maintenance given in TM 11-5805-356-12. Whenever possible, the organizational maintenance procedures.

## 3-2. Voltage and Resistance Measurements

a. Voltage Data. Voltage data for chassismounted components are provided by figure 3-1. The following paragraphs provide voltage data for parts mounted on pc boards and for test points. All voltage data were obtained using the ME-26B/U. The conditions under which the data were obtained are specified. When comparing actual measurements with the published data
for transistor voltages, it must be considered that voltages measured at the emitter and base terminals of transistors may vary by as much as 20 percent. Collector voltages, however should not vary by more than 10 percent. The bias (emit-ter-to-base) voltage should remain close to that obtained from the listed values.
(1) Transistor voltage. The following chart lists two voltages for each transistor element of transistors used in the receive circuit. The top voltage is measured with a vf ring signal (1232 at 0 dbm ) applied to the receive circuits. The bottom voltage is measured with no vf ring signal applied. Two voltages for each element are also listed for transistor 3Q1. The top voltage is measured with the power supply supplying its normal load; the bottom voltage is measured without a load on the power supply (pc boards removed from the CV-425/U).

| Transistor | Voltage to ground |  |  |
| :---: | :---: | :---: | :---: |
|  | Emitter | Collector | Base |
| 3A1Q1 (PNP) | $\begin{aligned} & -0.77 \\ & -1.25 \end{aligned}$ | $\begin{aligned} & -4.3 \\ & -3.6 \end{aligned}$ | $\begin{aligned} & -0.65 \\ & -1.25 \end{aligned}$ |
| $3 \mathrm{AlQ2}$ (PNP) | $\begin{array}{r} -6.2 \\ -3.5 \end{array}$ | $\begin{aligned} & -10.0 \\ & -12 \end{aligned}$ | $\begin{array}{r} -4.3 \\ -3.6 \end{array}$ |
| 3A1Q3 (PNP) | $\begin{aligned} & -1.0 \\ & -1.5 \end{aligned}$ | -18 -17 | $\begin{gathered} +0.1 \\ 0 \end{gathered}$ |
| $3 \mathrm{AlQ4}$ (PNP) | -2.3 -2.45 | -7.2 -17 | $\begin{array}{r} -1.9 \\ +0.1 \end{array}$ |
| 3A1Q5 (PNP) | $\begin{aligned} & -2.3 \\ & -2.45 \end{aligned}$ | $\begin{aligned} & -18 \\ & -6.8 \end{aligned}$ | $\begin{aligned} & -1.25 \\ & -2.6 \end{aligned}$ |
| 3A2Q1 (PNP) (when applicable) | -12 | $-18$ | $-12$ |
| 3A2Q2 (PNP) (when applicable) | $-12.0$ | $-18$ | -12 |
| 3Q1 (PNP) | $\begin{aligned} & -18 \\ & -18 \end{aligned}$ | $\begin{aligned} & -35 \\ & -41 \end{aligned}$ | $\begin{aligned} & -18 \\ & -18 \end{aligned}$ |

(2) Additional voltage data.

| Parts or circuit | Vtvm connection |  | Voltage (volts) | Condition |
| :---: | :---: | :---: | :---: | :---: |
| Relay 3K1 | 2 | 3 | +11 | $20-\mathrm{Hz}$ input at LOOP terminals. |
| Relay 3K2 | 2 | 3 | $+15$ | Vf input at LINE terminals. |
| Test point | A1TP1 | ground | $=0.75$ | Incoming vf voltage. |

| Parts or circuit | Vtvm connection |  | Voltage (volts) | Condition |
| :---: | :---: | :---: | :---: | :---: |
| Test point | A1TP1 | ground | -1.35 | No incoming vf voltage. |
| Test point | A1TP2 | ground | -11.4 | Incoming vf voltage. |
| Test point | A1TP2 | ground | -12.8 | No incoming vf voltage. |
| Test point | A1TP3 | ground | +3.2 | Incoming vf ring voltage. |
| Test point | A1TP3 | ground | +0.03 | No incoming vf ring voltage. |
| Power transformer 3T1 | 5 | -ground | 30 vac | None. |
| Power transformer 3T1 | 7 | ground | 30 vac | None. |

b. DC Resistance of Transformer, Inductor, and Relay Armature Windings. The following chart lists the ohmic resistance of transformer, inductor, and relay armature windings.

| Designation | Terminals | Resistance (ohms) |
| :---: | :---: | :---: |
| $3 \mathrm{AlT1}$ | 1-2 | $400 \pm 80$ |
|  | 3-4 | $270 \pm 54$ |
| 3A2T1 | 1-2 | $50 \pm 10$ |
|  | 3-4 | $50 \pm 10$ |
| 3A2L1 (when applicable) | 1-2 | $526 \pm 53$ |
| 3T1 | 1-3 | $62 \pm 9.3$ |
|  | 2-4 | $67 \pm 10$ |
|  | 5-7 | $9 \pm 1.4$ |
| 3K1 | 2-3 | 2,300 * minimum |
| 3K2 | 2-3 | $1,000 \pm 000$ |

- Negative meter lead connected to terminal 3.

FRONT
NOTES:

1. VOLTAGE READINGS ABOVE LINE, RESISTANCE READINGS BELOW LINE.
2. UNLESS OTHERWISE SHOWN, VOLTAGES AND RESISTANCES ARE MEASURED

TO GROUND. DC VOLTAGE READINGS TAKEN WITH A 20,000 OHMS-PER-VOLT METER.
3. - INDICATES MEASUREMENTS ARE MADE ACROSS THESE POINTS.
4. RESISTANCE MEASUREMENTS MADE WITH NEGATIVELEAD AT GROUND.

Figure 3-1. Chassis voltage and resistance diagram.

## 3-3. Continuity Tests

The following continuity test checks that the appropriate line terminal connections are established for settings of the $2 \mathrm{~W}-4 \mathrm{~W}$ switch. Addi-
tional tests within the equipment may be required when troubleshooting. Such additional tests should be made in accordance with the wiring diaman, figure FO-2, after removing the pc boards.

EL 5805-356-34-2-TM-4

Figure 3-2. Chassis rear view with pc in test position

## CAUTION

In making continuity and resistance checks independently without following a prescribed procedure, make sure not to apply a potential between transistor elements that could destroy the transistor. The battery contained in the TS$352 \mathrm{~B} / \mathrm{U}$ can destroy transistors by causing excessive current through them. In some instances, 0.1 volt applied between base and emitter in the reverse direction can destroy a surface barrier transistor. Never make any continuity checks with power applied to the CV425/U.

Figure FO-2. Wiring diagram. (Located in back of manual.)

## 3-4. Bench Testing

The maintenance procedures require access to the interior of the CV-425/U and, in many instances, to points on or below the pc boards. Proceed as follows:
a. Removal of Chassis from Case. Loosen the
three camlock screws on the unit front panel by turning them one-quarter turn counterclockwise; pull the chassis forward from the case.
b. Removal of PC Boards.
(1) Loosen the three screws on the hinged panel at the rear of the chassis (iig. 3-2), and lower the panel.
(2) Use the extractor handle to pull out the pc boards from the chassis mounting rails.
c. Adjusting PC Board to Test Position.
(1) Remove both pc boards from the chassis ( $b$ above).
(2) On both sides of the chassis, loosen the screw that holds the harness board connector mounting bracket.
(3) Rotate the harness board connector bracket upward so that the slotted center piece is straight up.
(4) Reinsert the pc boards in the harness board connector.
d. Restoration for Operation. To restore the CV-425/U for operation after maintenance procedures have been completed, reverse the procedures used in preparing the CV-425/U for maintenance.

## Section II. TOOLS AND TEST EQUIPMENT

The following chart lists the test equipment and tools required for direct support maintenance.

| Test equipment and tools | Associatiated technical |
| :---: | :---: |
| Electronic Counter TD-1209/U | TM 11-6625-2782-148P |
| Multimeter ME-26 B/U | TM 11-6625-200-15 |
| Multimeter TS-352B/U | TM 11-6625-366-10 |
| Oscilloscope <br> AN/USM-281C | TM 11-6625-2658-14 |
| Test Set AN/USM-181B | TM 11-6625-602-12-1 |

| Test equipment and tools | Associated technical <br> m a i n u a 1 |
| :--- | :--- |

## Section III. TROUBLESHOOTING

## 3-5. Introduction

Trouble in the CV-425/U is isolated in three stages. The procedure starts by making operational tests on the unit to identify the malfunction, which is then referred to under a symptom in the troubleshooting chart. The troubleshooting chart lists probable troubles that can cause the noted symptom. Probable troubles are eliminated, and the trouble causing the symptom is identified by utilizing additional data supplied. The additional data comprise voltage and resist ante measurements (fig 3-1), the schematic di-
agram (FO-1), the wiring diagram (FO-2), and the military standard color code markings (FO3). Reference may also be made to the circuit descriptions in chapter 2. If the trouble is isolated to a chassis-mounted part, repairs are authorized at direct support. If the trouble is isolated to a part mounted on a pc board, the pc board must be replaced. A notation should then be made stating the defect for which the pc board was replaced; this notation should accompany the pc board when it is forwarded to higher maintenance category for repair. After comple-
tion of repairs on the CV-425/U, the operational test must be repeated.

FO-3. Military standard color code markings.
(Located in back of manual.)
NOTE
Adjustment of the output frequency of the oscillator on send card 3A2 is not authorized for direct support maintenance. When adjustment is required, replace send card 3A2 and forward to higher maintenance category with notation.

## 3-6. Operational Tests

Perform the following operational tests in the sequence in which they are given. The tests are to be performed with the CV-425/U chassis removed from its case and pc boards erected in the test position para 3-4. Each test provides an indication that will be obtained when the circuit is operating normally. So long as the normal indications are obtained, continue with the operational tests. Upon completion of a test, disconnect the test equipment before continuing with the next test. When a normal indication is not obtained for one of the tests, locate the symptom that describes the failure in the troubleshooting chart (para 3-7). Investigate the probable causes associated with the noted symptom and take the corrective action suggested in the chart for the cause. Upon completion of the corrective action, make sure that the trouble has been corrected by repeating the operational test and noting that a normal indication is now obtained.

## NOTE

In the following operational tests, controls for which no setting is specified in the procedure may be left in any position. Use of either the TA-312/PT or TH-22/TG to produce the $20-\mathrm{Hz}$ ringing signal is optional.
a. Power Supply Output Voltage Test.
(1) Operate the POWER switch to OFF.
(2) Connect the CV-425/U to a power source.
(3) Operate the POWER switch to ON. Note that the POWER indicator lights.
(4) Use the ME-26(*)/U (set to measure -18 volts dc) to measure the voltage between ground and test point A2TP3 (fig. 3-3.1) or terminal P, fig. 3-3.2) if the 3A2 circuit card utilizes a sealed VF $\square$ OSC unit (Al). The meter should indicate $-18 \pm 1.8$ volts dc.
b. 20 Hz to Vf Circuit Output Frequency Test. (1) Operate the CV-425/U front panel con trol as follows:

| Control | Position |
| :---: | :---: |
| POWER | . ON |
| TP-TG. | TG |
| 2W-4W | .2W |
| SENSITIVITY | HIGH |

(2) Connect the TA-312/PT to LOOP 2 W 4WR binding posts of the CV-425/U under test.
(3) Connect COUNTER INPUT of an AN/ TSM-16 to the LINE 2W-4WS binding posts of the CV-425/U under test.
(4) Operate the TA-312/PT to produce a $20-\mathrm{Hz}$ ringing signal. TD-1209/U should read $1232.5 \pm$ 10 Hz .
(5) Set TP-TG switch to TP and operate $\mathrm{TH}-22 / \mathrm{TG}$ to produce a $20-\mathrm{Hz}$ ringing signal. TD-1209/U should read $1600 \pm 10 \mathrm{~Hz}$.
c. 20 Hz to Vf Circuit Output Level Test.
(1) Operate the CV-425/U front panel controls as follows:

| Control | Position |
| :---: | :---: |
| POWER | ON |
| TP-TG | TG |
| 2W-4W | 2W |
| SENSITIVITY | HIGH |

(2) Connect the INPUT of an ME-22/PCM to the LINE $2 \mathrm{~W}-4 \mathrm{WS}$ binding posts of the CV425/U under test.
(3) Connect the TA-312/PT binding posts to LOOP 2W-4WR binding posts of the CV-425/ U under test.
(4) Operate the TA-312/PT to produce a $20-\mathrm{Hz}$ ringing signal. ME-22/PCM should indicate 0 $\pm 2 \mathrm{dbm}$.
(5) Set TP-TG switch to TP and operate TH-22/TG to produce a $20-\mathrm{Hz}$ ringing signal. ME-22/PGM should indicate $0 \pm 2 \mathrm{dbm}$.
d. Vf to $20-\mathrm{Hz}$ Circuit Frequency Sensitivity Test.
(1) Operate the CV-425/U front panel controls as follows:

| Control | Position |
| :---: | :---: |
| POWER. | ON |
| TP-TG | TG |
| 2W-4W | 2W |
| SENSITIVITY | LOW |

(2) Connect the 1500 -ohm resistor and the $5-\mu \mathrm{f}$ capacitor (series connected) load to the LOOP $2 \mathrm{~W}-4 \mathrm{WR}$ binding posts of the CV-425/U under test. Also connect the input of the AN/USM-281 C to the LOOP $2 \mathrm{~W}-4 \mathrm{WR}$ binding posts.

Figure 3-3.1. $20-\mathrm{Hz}$ to vf card $3 A 2$ component layout and wiring diagram (discrete components.)
(3) Connect the OUTPUT of an SG-15/PCM to the LINE $2-\mathrm{W}-4 \mathrm{WS}$ binding posts of the CV-425/U under test.
(4) Slowly change the SG-15/PCM frequency from 1195 through 1260 Hz while maintaining the output level of $0 \pm 2 \mathrm{dbm}$. The AN/USM-281C should
display a $20 \pm 3 \mathrm{~Hz}$ signal of 90 V minimum peak-topeak.
(5) Set TP-TG switch to TP and slowly change output of SG-15/PCM from 1570 Hz through 1630 Hz. AN/USM-281C should display a $20 \pm 8 \mathrm{~Hz}$ signal of 90 V minimum peak-to-peak.

Figure 3-3.2. $20-\mathrm{Hz}$ to vf card 3A2 component layout and wiring diagram
(sealed VF-OSC).
e. Vf to $20-\mathrm{Hz}$ Circuit Vf Sensitivity Test.
(1) Operate the CV-425/U front panel controls as follows:

| Control | Position |
| :---: | :---: |
| P O W ER | ON |
| TP-TG | T G |
| 2W-4W | 2 W |

## SENSITIVITY <br> HIGH

(2) Connect the 1500 -ohm resistor and the $5-\mu \mathrm{f}$ capacitor (series connected) load to the LOOP $2 \mathrm{~W}-4 \mathrm{WR}$ binding posts of the CV-425/U under test. Also connect the input of the AN/USM-281C to the LOOP $2 \mathrm{~W}-4 \mathrm{WR}$ binding posts.
(3) Connect the OUTPUT of an SG-15/PCM to the LINE $2 \mathrm{~W}-4 \mathrm{WS}$ binding posts of the CV-425/U under test.
(4) Adjust SG-15/PCM for a $1232.5-\mathrm{Hz}-45$ dbm output. AN/USM-28lC should display a $20 \pm 3$ Hz signal of 90 V minimum peak-to-peak with the TP-TG switch in TG position.
(5) Adjust SG-15/PCM for a $1600-\mathrm{Hz}-30 \mathrm{dbm}$ output. AN/USM-281C should display a $20 \pm 3 \mathrm{~Hz}$ signal of 90 V minimum peak-to-peak in TP and LOW

SENSITIVITY switch position on the CV--425/U.

## 3-7. Localizing Trouble

a. General. Procedures are outlined in the troubleshooting chart (b below) for localizing troubles to the individual circuit or component. The procedures are initiated as a result of failing to obtain the indicated results when performing the operational test (para $\beta^{-6)}$. When the procedure results in tracing the trouble to a pc board, replace the board. If the trouble is traced to a stage on the chassis, use voltage and resistance measurements as required to isolate the trouble to a defective part. Voltage and resistance data are provided in paragraph 3-2 and in figure 3-1. In the chart, the component reference designation indicates its physical location in the CV-425/U as follows: 3 indicates the chassis assembly; 3A1 indicates receive card 3A1; and 3A2 indicates send card 3A2. The physical location of components and test points is illustrated in figure 3-2 through 3-6.

## b. Troubleshooting Chart.

| Item | Symptom | Probable trouble | Correction |
| :---: | :---: | :---: | :---: |
| 1 | Voltage measured at test point 3A2TP3 (or card terminal P where sealed VF OSC unit (A1) is used) is not -18 volts dc $\pm 1.8$ and/or POWER indicator lamp does not glow. | a. Defective resistor 3R3 fig. 3-4 <br> b. Defective POWER switch 3S4, power cord, or power plug ffig. 3-4. <br> c. Defective capacitor 3C1 fig. 3-2 <br> d. Defective power transformer 3T1 fig. 3-2). <br> e. Defective voltage regulator 3Q13A2CR7 fig. 3-2). <br> $f$. Defective rectifier 3A2CR53A2CR6. | a. Check resistance of 3 R3 and replace if defective. <br> b. Perform continuity test and replace defective part. <br> c. Check 3C1 for short and replace TP if defective. <br> d. Perform voltage test (fig. 3-1) and replace if defective. <br> e. Perform voltage test to determine defect. Replace transistor 3 Ql or send card 3A2, as required. <br> f. Replace defective send card 3A2. |
| 2 | No $20-\mathrm{Hz}$ output when vf input of correct amplitude and frequency is applied to the LINE terminals. (Correct amplitude is greater than -45 dbm when SENSITIVITY switch is at HIGH, -30 dbm when at LOW. Correct frequency is $1,232.5 \mathrm{~Hz}$ when TP-TG switch is at TG; $1,600 \mathrm{~Hz}$ when at TP .) | a. Defective $20-\mathrm{Hz}$ ringer 3 Z 1 fig. 3-2). <br> b. Defective ballast lamp 3DS1 or holder (fig. 3-5). <br> c. Defective $2 \mathrm{~W}-4 \mathrm{~W}$ switch 3 S 1 , relay 3 K 1 , or relay 3 K 2 fig. 3-5. <br> d. Defective receive card 3.41 fig. 3-2). <br> $e$. Defective discriminator transformer 3Z2 fig. 3-2. <br> $f$. Defective TP-TG switch 3S2 fig. 3-5). | a. Check for $20-\mathrm{Hz}$ output at terminals 3 and 4 of $20-\mathrm{Hz}$ ringer and replace if defective. <br> b. Perform continuity test on ballast lamp and holder and replace if defective. <br> c. Perform continuity test to determine defective part. Replace defective part. <br> d. Replace receive card 3A1. <br> e. Replace discriminator transformer $3 Z 2$. <br> $f$. Check switch and replace if defective. |

| Item | Symptom | Probable trouble | Correction |
| :---: | :---: | :---: | :---: |
| 3 | Sensitivity does not change when SENSITIVITY switch position is changed. | a. Defective SENSITIVITY switch 3S3 (flan. ?-b). <br> b. Defective capacitor 3 C 2 (fig. ., 5) | a. Check switch $3 S 3$ and replace if defective. <br> b. Check capacitor and replace if defective. |
| 4 | Guard circuit slow or inoperative (vf ring signal produces 20 Hz after being present for more than 2 seconds). | Defective receive card 3 Al 1 ( fig. $3-\mathrm{l}$ ) | Replace receive card. |
| 5 | $20-\mathrm{Hz}$ output level | Defective $20-\mathrm{Hz}$ ringer 3 Zl ( fig. 3 \% ) | Replace $20-\mathrm{Hz}$ ringer. |
| 6 | $20-\mathrm{Hz}$ output at all times | a. Defective receive card $3 A 1$ (fig. 3-2). <br> b. Defective relay 3 K 2 (fig | r. Replace receive card. <br> b. Check relay and replace if defective. |
| 7 | No vf output when $20-\mathrm{Hz}$ input is applied to LOOP terminals. | 1. Defective send card $3 A 2$ (fig. 3-2). <br> b. Defective relay 3 K 1 or diode 3 CR 1 (fig. 3-2 $)$. | a. Replace send card. <br> b. Check relay and diode and replace if defective. |
| 8 | Low vf output | Defective send card 3A1 (fig. 3-2) | Replace send card. |
| 9 | Incorrect output frequency for telephone and telegraph operation. | Oscillato | Replace send card 3 2 ( fig. 3-2). |
| 10 | Incorrect output frequency for telegraph operation only. | a. Defective send card 3A2 (fig. 3 ? 2 ) <br> b. Defective switch 3 S2 (fig | a. Replace send card. <br> b. Check switch and replace if defective. |
| 11 | Vf output when there is no 20Hz input. | Defective relay 3 K 1 | Replace relay. |
| 12 | Unit not responsive to $20-\mathrm{Hz}$ voltage down to 50 volts peak-to-peak. | a. Defective relay 3 K 1 (fig. 3-2) <br> b. Defective $20-\mathrm{Hz}$ detector 3 A 2 CR 1 to 3A2CR4. | a. Check relay and replace if defective. <br> b. Replace send card 3 A2 (fig. 32). |
| 13 | Signal loss through unit exceeds 0.5 db . | a. Defective relay 3 K 1 or relay 3 K 2 (fig. 3-2). <br> b. Defective $2 W-4 W$ switch $3 S_{1}$ (fig. 35 ). <br> c. Defective input transformer 3A1T1 or associated components in primary of transformer on receive card 3A1. | a. Check relays and replace if defective. <br> b. Check switch and replace if defective. <br> c. Replace receive card (fig. 5-2). |

# GENERAL SUPPORT MAINTENANCE INSTRUCTIONS 

## Section I. GENERAL

## 4-1. Scope of General Support Maintenance

a. General support maintenance consists of testing (b below) the CV-425/U and its component pc boards. Troubleshooting is performed using the information supplied for direct support maintenance.
b. General support maintenance testing procedures consist of complete final testing procedures for the $\mathrm{CV}-425 / \mathrm{U}$. These procedures determine the acceptability of repaired equipment by testing the equipment against specific requirements. The repaired equipment must meet these requirements before it is returned to the using organization. The general support testing pro-
cedures are covered in paragraphs 4-5 through 4-9.

## 4-2. Fabrication of Test Cable

a. General. To perform the general support maintenance tests, fabricate a 600 -ohm hookup cable.
b. 600-ohm hookup cable.
(1) Cut two 2-foot lengths of hookup wire.
(2) Strip $1 / 2$ inch of insulation from both ends of each wire.
(3) Connect and solder one wire to each 600-ohm resistor lead.
(4) Tape exposed wires.

## Section II. TOOLS AND TEST EQUIPMENT

## 4-3. Test Equipment and Tools Required, General Support Maintenance

The following chart lists the test equipment and tools required for general support maintenance.

| Test equipment and tools | Associated technical manual |
| :---: | :---: |
| Decade capacitor, FSN 6625-2209441, part of Laboratory Standards AN/URM-2A | Commercial litera- ture |
| Frequency Meter AN/TSM-16 | TM 11-6625-218-12 |
| Multimeter ME-26B/U | TM 11-6625-219-12 |
| Multimeter TS-352B/U | TM 11-5527 |
| Oscilloscope AN/USM-81 | TM 11-6625-219-12 |
| Test Set TS-140/PCM | TM 11-6625-251-15 |
| Consisting of: Decibel Meter ME-22/PCM Signal Generator SG-15/PCM |  |

| Test equipment and tools | Associated technical manual |
| :---: | :---: |
| Teletypewriter GGM-1 Test Set AN/ | TM 11-6625-422-12 |
| Transistor Test Set TS-1836/U | TM 11-6625-539-15 |
| Electronic Equipment Tool Kit TK-100/G | Not applicable |
| Electronic Equipment Tool Kit TK-105/G | Not applicable |
| Telegraph-Telephone Terminal AN/TCC-29 | TM 11-5805-356-12 |

## 4-4. Material Required, General Support Maintenance

The material required for general support maintenance consists of 25 feet of No. 20 insulated copper hookup wire and one 2 -watt, 600 -ohm $\pm 5$ percent carbon resistor.

Section III. TROUBLESHOOTING
Refer to Chapter 3, Section III.

## Section IV. MAINTENANCE OF CV-425/U

## 4-5. Repair Procedures

The general support repair procedures consist of replacing parts and repair of the pc boards of the CV-425/U. These procedures require the use of Electronic Equipment Tool Kits TK-100/G and TK-105/G. Follow the procedures in $a$ below when replacing transistors, $b$ below when replacing parts, and $c$ below when repairing pc boards.

## a. Transistor Replacement.

(1) Use a pencil-type soldering iron with a 25-watt maximum capacity.

## CAUTION

Never bring the soldering iron into dirrect contact with the transistor body or any heat conductor which is in direct contact with the transistor body. The excessive temperature will destroy the transistor.
(2) When soldering transistor leads, solder quickly; use a heat sink (such as a long-nose pliers) between the soldered joint and the transistor.
(3) Use approximately the same length and dress for transistor leads as used originally.

## b. Part Replacement.

(1) Remove the part by cutting the leads approximately one-sixteenth of an inch from the printed circuit board.

## CAUTION

Never bring the soldering iron into direct contact with the printed circuit. Excessive heat will damage the printed circuit.
(2) Remove the leads from the printed circuit by applying the iron to the lead until the solder melts at the junction.
(3) Remove the excess solder from the junction on the printed circuit board with a small drill. Always drill from the printed circuit side of the board to prevent loosening of the printed circuit foil.
(4) Use approximately the same length and dress for part leads as was used originally.
(5) Solder the component leads to the printed circuit by applying the soldering iron to the component lead and removing the iron as soon as the solder flows into the junction.
c. PC Board Repair. Proceed as follows if the foil of the pc board is loose or broken.
(1) Remove the loose or broken foil by cutting it as close to the board as possible.
(2) Cut a piece of tinned 20 -gage copper wire one-half inch longer than the span of the removed section of foil.
(3) Bend each end of the copper wire onequarter inch from the ends until its shape resembles a staple.
(4) Drill a small hole in the board at each end of the span where the loose or broken foil was removed. If the foil at each end of the span is one-quarter inch or more in width, drill the holes directly into the foil.
(5) Insert the ends of the copper wire from the component side of the board and bend the ends across the foil.
(6) Solder the junctions of the foil and copper wire by applying the soldering iron to the copper wire.

## Section V. GENERAL SUPPORT TESTING PROCEDURES

## 4-6. Physical Test and Inspection

a. Test Equipment and Materials. None required.
b. Test Connections and Conditions. Remove the CV-42WU from its case.
C. Procedure.

| $\begin{aligned} & \text { Step } \\ & \text { No. } \end{aligned}$ | Control settings |  | Test procedure | Performance standard |
| :---: | :---: | :---: | :---: | :---: |
|  | Test equipment | Equipment under test |  |  |
| 1 | N/A | N/A | a. Inspect all controls and assemblies for missing screws, bolts, añd nuts. | a. Screws, bolts, and nuts are tight; none missing. |

| $\begin{aligned} & \text { Step } \\ & \text { No. } \end{aligned}$ | Control settings |  | Test procedure | Performance tandard |
| :---: | :---: | :---: | :---: | :---: |
|  | Test equipment | Equipment under test |  |  |
|  |  |  | b. Inspect all connectors, sockets, and receptacles, including the fuseholder, for looseness and damage. <br> c. Inspect case and chassis for damage, missing parts, condition of finish, and panel lettering. <br> Note. Touch-up painting is recommended in lieu of refinishing whenever practicable. Screwheads, binding posts, receptacles, and plated fastener parts will not be painted or polished with abrasives. | b. No loosencss or damage evident. <br> c. No damage or missing parts evident. External surfaces intended to be painted do not show bare metal. Panel lettering legible. |
| 2 |  | N/A | Check pe board assembly, that has been disturbed and repaired, for missing epoxy coating. | All repaired or disturbed components and surfaces are covered. <br> Note. Equipment surfaces that had no coating do not require treatment during general support repair. |
| 3 | N/A...-.... . . . . . . . . . - - - | N/A. | Check the equipment for applicable modification work orders. |  |

## 4-7. Oscillator Frequency Adjustment <br> NOTE

This adjustment is not applicable for cards with sealed VF-OSC units (fig. 3-3.2).
a. Test Equipment and Materials.
(1) Frequency Meter TD-1209/U.
(2) Telephone Set TA-312/PT.
(3) Hookup wire (10 ft.).
b. Test Connections and Conditions.
(1) Connect the TA-312/PT 4WS TEL terminals to the CV-425/U 4W-S loop terminals.
(2) Connect the CV-425/U 4W-S LINE terminals to the TD-1209/U counter input.

## c. Procedure.

(1) Set the CV-425/U controls as follows:
Controd

Ponition
POWER
ON
TP-TG TP
$2 W-4 W$ 4W

## NOTE

The send oscillator output becomes available at the CV-425/U LINE terminals only when a $20-\mathrm{Hz}$ ring signal
is applied to the LOOP terminals. Throughout this procedure, operate the TA-312/PT ringer whenever the oscillator output is required.
(2) While operating TA-312/PT ringer, adjust capacitor A2C2 (fig. ${ }^{3}-4$ ) to obtain an indication of $1600 \pm 10 \mathrm{~Hz}$ on the TD-1209/U.
(3) Set the CV-125/U TP-TG switch to TG.
(4) While operating TA-312/PT ringer, adjust capacitor A2C1 (fig. 3-1) to obtain an indication of $1232.5 \pm 10 \mathrm{~Hz}$ on the TD-1209/U.

## 4-8. 2-Wire Operational Test

a. Test Equipment and Materials.
(1) Terminal Telegraph TH-22/TC (2).
(2) Converter Telegraph-Telephone Signal CV-425/U.
(3) Hookup wire (24 ft).
b. Test Connections and Conditions. Using three pairs of hookup wires (designated 2-wire test hookup wire), connect two standard TH-22/ TC's, one standard CV-425/U, and the CV-425/U under test as shown in figure 4-1. Omit all other hookup wires shown.

Figure 4-1. Operational Test Setup.
c. Initial Test Equipment Settings. None.
d. Procedure.

| $\begin{aligned} & \text { Step } \\ & \text { No. } \end{aligned}$ | Control settings |  | Test procedure | Performance standard |
| :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { Test } \\ \text { equipment } \end{gathered}$ | Equipment under test |  |  |
| 1 | CV-425/U (standard) 2W-4W: 2W TP-TG: TG Sensitivity: LOW Power: ON TH-22/TC(2) ON-OFF: ON 4W-2W-TEL: $2 W$ Norm-Rec-Send: Norm VF-20~: 20~ | $\begin{aligned} & \hline \text { CV-425/U } \\ & 2 \mathrm{~W}-4 \mathrm{~W}: 2 \mathrm{~W} \\ & \text { TP-TG:TG } \end{aligned}$ <br> Sensitivity : LOW <br> Power: ON | Depress TH-22/TC (A) RING switch. | TH-22/TC (B) speaker produces audible tone. |
| 2 | Same as above except: TP-TG: TP. | Same as above except TP-TG: TP. | Same as above | TH-22/TC (B) Speaker produces audible tone. <br> NOTE <br> On some equipment, when using the short-wire hookup of figure 4-1, a break-in condition at position A TH-22/TG will occur as the RING switch is released. This produces an audible tone in both speakers. Operate the position A TH-22/TG RESET switch to silence the speakers and return the equipment to normal. |
| 3 | Same as 1 above | Same as 1 above | Depress TH-22/TC (B) RING switch. | TH-22/TC (A) Speaker produces audible tone. |
| 4 | Same as 1 above except TP-TG: TP. | Same as 1 above except TP-TG: TP. | Depress TH-22/TC (B) RING switch. | TH-22/TC (A) Speaker produces audible tone. <br> NOTE <br> On some equipment, when using the short-wire hookup of figtre $4-1$, a break-in condition at position B TH-22/TG will occur as the RING switch is released. This produces an audible tone in both speakers. Operate the position B TH-22/TG RESET switch to silence the speakers and return the equipment to normal. |

## 4-9. 4-Wire Operational Test

a. Test Equipment and Material.
(1) Terminal Telegraph TH-22/TC (2).
(2) Converter Telegraph-Telephone Signal CV-425/U.
(3) Hookup wire (42 ft).
b. Test Connections and Conditions. Using 6 pairs of hookup wires (designated 4 -wire test hookup wire) connect two standard TH-22/TC's, one standard CV-425/U and the CV-425/U under test as shown in figure 4-1. Omit all other hookup wires shown.
c. Initial Test Equipment Settings. None
d. Procedure.

| $\begin{aligned} & \text { Step } \\ & \text { No. } \end{aligned}$ | Control settings |  | Test procedure | Performance standard |
| :---: | :---: | :---: | :---: | :---: |
|  | Test equipment | Equipment under test |  |  |

## APPENDIX B

## DIRECT SUPPORT, GENERAL SUPPORT, AND DEPOT MAINTENANCE REPAIR PARTS

## Section I. INTRODUCTION

## B-1. General

This appendix contains a list of repair parts required for the performance of direct support, general support, and depot maintenance for Converter, Telegraph-Telephone Signal CV-425/U.

## NOTE

No special tools, test, and support equipment are required.

## B-2. Explanation of Sections

This repair parts list is divided into four principal sections.
a. Repair Parts for Direct Support, General Support, and Depot Maintenance Section II. A list of repair parts authorized for the performance of maintenance at direct support, general support and depot.
b. Federal Stock Number Cross-Reference to Index Number-Section III. An index of Federal stock numbers and manufacturer's part number to index numbers.
c. Figure and Item Number Cross-Reference to Index Number-Section IV. An index of illustrated items to line items by index numbers. The line item index numbers appear in the SMR code column of the repair parts list directly under the code letters in ascending sequence for each item. The index number for an item will be the same for that item in all repair parts lists of this equipment.
d. Reference Designation Cross-Reference to Index Number-Section $V$. An index of reference designations to index numbers.

## B-3. Explanation of Columns

The following is an explanation of the columns in Section II:
a. Source, Maintenance, and Recoverability Codes (SMR), Column 1. The first column on the left of the repair parts list contains the source,
maintenance, and recoverability (SMR) codes, where applicable, and an index number listed below the SMR codes in ascending order. The index number is related to automatic data processing in supply functions, but may also be used as a locator for the line item, when reference designations are not in alphanumerical sequence. The SMR codes used in this list are-
(1) Source code. The source code is the letter appearing on the left in the SMR column. It indicates the source from which the item is obtained in accordance with the following:
Code . Explanation
P.... Applies to repair parts which are stocked in or supplied from the GSA/DSA, or Army supply system, and authorized for use at indicated maintenance categories.
M..... Applies to repair parts which are not procured or stocked but are to be manufactured at indicated maintenance categories.
X1.....Applies to repair parts which are not procured or stocked, the requirement for which will be supplied by use of next higher assembly or component,
X2 ..... Applies to repair parts which are not stocked. The indicated maintenance category requiring such repair parts will attempt to obtain such parts through cannibalization. If they are not obtainable through cannibalization, such repair parts will be requisitioned with supporting justification through normal supply channels.
G.....Applies to major assemblies that are procured with PEMA funds for initial issue only to be used as exchange assemblies at DSU and GSU category. These assemblies will not be stocked above DSU and GSU category or returned to depot supply category.
(2) Maintenance code. The maintenance code is the letter appearing in the center of the SMR column. It indicates the lowest category of maintenance authorized to install the listed item. The codes are as follows:

| Code | Explanation |
| :---: | :--- |
| O | Organizational maintenance |
| F | Direct support maintenance |
| H | General support maintenance |
| D | Depot maintenance |

(3) Recoverability code. The right-hand letter in the SMR column indicates whether the item should be returned for recovery or salvage. Recoverability codes are as follows:

## NOTE

When no code is indicated in the recoverability column, the part will be considered expendable.

$$
\text { Code } \quad \text { Explanation }
$$

R Applies to repair parts and assemblies which are economically reparable at DSU and GSU activities and normally are furnished by supply on an exchange basis.
U Applies to repair parts specifically selected for salvage by reclamation units because of precious metal content, critical materials, high dollar value, and reusable casings or castings.
b. Federal Stock Number, Column 2. The Federal stock number for the item is indicated in this column.
c. Description, Column 3. This column indicates the Federal item name and any additional description of the item required. A part number or other reference number is followed by the applicable five-digit Federal Supply Code for Manufacturers, When an item is repeated several times in the list, only the first appearance carries a description. For subsequent appearances of the item, the description column will read "Same as" followed by the index number of the first appearance; for example, RESISTOR, FIXED COMPOSITION : SAME AS A298.

## NOTE

Usable on code column is not used.
d. Unit of Issue, Column 4. The unit used as a basis of issue (e.g., ea, pr, ft, yd, etc) is noted in this column.
e. Quantity Incorporated in Unit Pack, Column 5. Not used.
f. Quantity Incorporated in Unit, Column 6. The quantity of repair parts in an assembly is indicated in this column. Subsequent appearances of the same item in the same assembly are indicated by the letters "REF."

## g. Maintenance Allowances, Column and 8.

(1) The allowance columns are divided into subcolumns. The total quantity of items authorized for the number of equipments supported is indicated in each subcolumn opposite the first appearance of each item. Subsequent appearances of the same item will have no entry in the allowante columns but will have a reference, in the description column, to the first appearance of the item. Items authorized for use as required but not for initial stockage are identified with an asterisk(*) in the allowance column.
(2) The quantitative allowances for DS/ GS categories of maintenance will represent initial stockage for a 30 -day period for the number of equipments supported.
h. One-Year Allowances Per 100 Equipment/ Contingency Planing Purposes, Column 9. Opposite the first appearance of each item, the total quantity required for distribution and contingency planning purposes is indicated when applicable. The range of items indicates total quantities of all authorized items required to provide for adequate support of 100 equipments for 1 year.
i. Illustrations, Column, 11.
(1) Figure number, column 11a. The figure number of the illustration in which the item is shown, and the maintenance-level suffix number of the technical manual in which the illustration appears is included in this column. For example, if the illustration in which the item is shown in figure $1-13$ of the operator's ( -10 ) manual, the manual suffix -10 appears on the first line and the illustration number 1-13 on the second line.
(2) Item or symbol number, column $11 b$. The callout number used to reference the item in the illustration is indicated in this column.

## B-4. Location of Repair Parts

a. This appendix contains three cross-reference indexes (sec. III, IV, and V), to be used to locate a repair part when either the Federal
stock number, reference number (manufacturer's part number), figure number, or reference designation and or item number is known. The first column in each cross-referenee index is prepared, as applicable, in numerical or alphanumerical sequence. The last column of each crossreference index lists the index number assigned to the part.
b. Refer to the appropriate cross-reference index (para B-2b, $c, d$ ) and note the index number in the last column: then refer to the repair parts list to locate the index number which is listed in ascending order in column 1.

## B-5. Federal Supply Codes

This paragraph lists the Federal supply code and the associated manufacturer's name,

| code | Manufacturer |
| :---: | :---: |
| 06540 | Amathon Electronic Hardware Co., Inc. |
| 13057 | The Gosher Mfg. Co., Inc. |
| 16677 | Delco Mfg. and Sales Co., Inc. |
| 28520 | Jeyman Mfg. Co. |
| 54715 | Shure Bros. Inc. |
| 71468 | ITT Cannon Electric Inc. |
| 78189 | Shakeproof Division of Illinois Tool Works Inc. |
| 79963 | Zierick Mfg. Corp. |
| 80063 | Army Electronics Command Procurement and Production Directorate |
| 80064 | Naval Ship Systems Command |
| 81073 | - Grayhill Inc. |
| 81349 | Military Specifications |
| 81350 | Joint Army-Navy Specifications |
| 92701 | Harry B. Davies |
| 94375 | Automatic Metal Products Co. |
| 95263 | . Leecraft Mfg. Co., Inc. |
| 95987 | Wechesser Co., Inc. |
| 96238 | Stelma Inc. |
| 96906 | Military Standards |
| 98291 | Sealectro Corn. |

## This fine document...

Was brought to you by me:

## Liberated Manuals -- free army and government manuals

Why do I do it? I am tired of sleazy CD-ROM sellers, who take publicly available information, slap "watermarks" and other junk on it, and sell it. Those masters of search engine manipulation make sure that their sites that sell free information, come up first in search engines. They did not create it... They did not even scan it... Why should they get your money? Why are not letting you give those free manuals to your friends?

I am setting this document FREE. This document was made by the US Government and is NOT protected by Copyright. Feel free to share, republish, sell and so on.

I am not asking you for donations, fees or handouts. If you can, please provide a link to liberatedmanuals.com, so that free manuals come up first in search engines:
<A HREF=http://www.liberatedmanuals.com/>Free Military and Government Manuals</A>

- Sincerely Igor Chudov
http://igor.chudov.com/

[^0]:    - INTIMATE COVERING OF ANTISTATIC MATERIAL WITH AN OUTER WRAP OF EITHER TYPE 1 ALUMINIZED MATERIAL OR CONDUCTIVE PLASTIC FILM- OR -HYBRID LAMINATED BAGS HAVING AN INTERIOR OF ANTISTATIC MATERIAL WITH AN OUTER METALIZED LAYER
    - LABEL WITH SENSITIVE ELECTRONIC SYMBOL AND CAUTION NOTE

[^1]:    * This manual together with TM 11-5805-35-34-1, 13 October 1972, supersedes TM 11-5805-356-35, 9 December 1966, including all changes.
    ** Portions of this manual pertaining to repair parts and special tools list are superseded $\mathrm{b} V$ TM 11-5805-356-34P-2. dated 9 December 1976.
