CHANGE
No. 1

HEADQUARTERS
DEPARTMENT OF THE ARMY
Washington, DC, 11 October 1984

## OPERATOR'S ORGANIZATIONAL, DIRECT SUPPORT, AND GENERAL SUPPORT MAINTENANCE MANUAL <br> INTERCOMMUNICATION STATIONS <br> LS-518A /SIC (NSN 5830-01-018-1202) <br> AND <br> LS-519A/SIC (NSN 5830-01-020-6280) <br> AND <br> TEST SET, INTERCOMMUNICATION <br> TS-3990/SIC (NSN 6625-01-126-4886)

TM 11-5830-258-14, 28 June 1983, is changed as follows:

1. Title of the manual is changed as shown above.
2. New or changed material is indicated by a vertical bar in the margin of the page. Added or revised illustrations are indicated by a vertical bar next to the figure caption.
3. Remove old pages and insert new pages as indicated below:

4. File this change sheet in front of the publication.

By Order of the Secretary of the Army:

JOHN A. WICKHAM JR. General, United States Army
Official:
Chief of Staff

ROBERTM. JOYCE
Major General, United States Army
The Adjutant General

Distribution:
To he distributed in accordance with special list.

## WARNING

Operation of this equipment involves the use of voltages which are dangerous to life. Proceed with caution when troubleshooting in areas where live circuits are exposed. Do not service or make adjustments without the immediate presence or assistance of another person capable of rendering aid.

## WARNING

Adequate ventilation should be provided while using TRICHLOROTRIFLUOROETHANE. Prolonged breathing of vapor should be avoided. The solvent should not be used near heat or open flame; the products of decomposition are toxic and irritating. Since TRICHLOROTRIFLUOROETHANE dissolves natural oils, prolonged contact with the skin should be avoided. When necessary, use gloves which the solvent cannot penetrate. If the solvent is taken internally, consult a physician immediately.

## Change 1 A

(2) IF POSSIBLE, TURN OFF THE ELECTRICAL
POWER
(3) IF YOU CANNOT TURN OFF THE ELECTRICAL POWER, PULL, PUSH, OR LIFT THE PERSON TO SAFETY USING A WOODEN POLE OR A ROPE OR SOME OTHER INSULATING MATERIAL
(4) SEND FOR HELP AS SOON AS POSSIble

(5)
AFTER THE INJURED PERSON IS FREE OF CONTACT WITH THE SOURCE OF ELECTRICAL SHOCK, MOVE THE PERSON A SHORT DISTANCE AWAY AND IMMEDIATELY START ARTIFICIAL RESUSCITATION

Reproduction for non-military use of the information or illustrations contained in this publication is not permitted. The policy for military use reproduction is established for the Army in AR 380-5, for the Navy and Marine Corp in OPNAVINST 5510.1B, and the Air Force in Air Force Regulation 205.1.

## REPORTING ERRORS AND RECOMMENDING IMPROVEMENTS

You can help improve this manual. If you find any mistakes or if you know of a way to improve the procedures, please let us know. Mail your letter, DA Form 2028 (Recommended Changes to Publications and Blank Forms), or DA Form 2028-2 located in the back of this manual direct to: Commander, US Army Communications-Electronics Command and Fort Monmouth, ATTN: DRSEL-ME-MP, Fort Monmouth, New Jersey 07703.

In either case, a reply will be furnished direct to you.

This manual is an authentication of the manufacturer's commercial literature which, through usage, has been found to cover the data required to operate and maintain the equipment. Since the manual was not prepared in accordance with MIL-SPECS and AR 310-3, the format has not been structured to consider levels of maintenance, nor is it structured to the normal style of military publications.

## CHAPTER 0

## INTRODUCTION

This manual contains information and instructions for on-site operation and maintenance of Intercommunication Stations LS-518A/SIC and LS519A/SIC. The information identifies useful forms and publications, describes the sets, and lists significant performance and configuration data. The manual also contains appendixes of reference information.

0-2. Consolidated Index of Army Publications and Blank Forms.

Refer to the latest issue of DA Pam 310-1 to determine whether there are new editions, changes or additional publications pertaining to the equipment.

## 0-3. Maintenance Forms, Records, and Reports

a. Reports of Maintenance and Unsatisfactory Equipment. Department of the Army forms and procedures used for equipment maintenance will be those prescribed by TM 38-750, The Army Maintenance Management System (Army).
b. Report of Packaging and Handling Deficiencies. Fill out and forward SF 364 (Report of Discrepancy (ROD)) as prescribed in AR 735-11-2/DLAR 4140.55/NAVMATINST 4355.73/AFR 400-54/ MCO 4430.3E.
c. Discrepancy in Shipment Report (DISREP) (SF 361).

Fill out and forward Discrepancy in Shipment Report (DISREP) (SF 361) as prescribed in AR 5538/NAVSUPINST 4610.33B/AFR 75-18/ MCO P4610.19C/DLAR 4500.15.

0-4. Reporting Equipment Improvement Recommendations (EIR)

If your LS-518A/SIC or LS-519A/SIC needs improvement, let us know. Send us an EIR. You, the user, are the only one who can tell us what you don't like about your equipment. Let us know why you don't like the design. Put it on an SF 368 (Quality Deficiency Report). Mail it to Commander, US Army Communications-Electronics Command and Fort Monmouth, ATTN: DRSEL-ME-MP, Fort Monmouth, New Jersey 07703 . We'll send you a reply.

## $0-5$. Administrative Storage

For procedures, forms and records, and inspections required during administrative storage of this equipment, refer to preventive maintenance schedule in TM2 740-90-1, Administrative Storage of Equipment.

0-6. Destruction of Army Materiel to Prevent Enemy Use

Destruction of Army materiel to prevent enemy use shall be as prescribed in TM 750-244-2.

## 0-1/(0-2 blank)

Figure 1-1. Intercommunication Stations Type LS-518AISIC and Type LS-519AISIC, Interrelationship of Units.

## CHAPTER 1

## GENERAL INFORMATION

## 1-1. INTRODUCTION.

1-2. This Technical Manual, consisting of a single volume, provides general information, operating instructions, functional descriptions, maintenance routines, troubleshooting guides, and installation requirements for both the Type LS-518A/SIC and the Type LS-519A/SIC Intercommunication Stations manufactured by DYNALEC Corporation in Sodus, New York. The LS-518A/SIC is identical to the LS519A/SIC in every respect except for the quantity of station selector switches. The LS-518A/SIC has one 10 pushbutton selector switch assembly and is capable of operating in conjunction with up to 10 other communication stations in any combination regardless of type. The LS-519A/SIC has two 10 pushbutton switch assemblies and is capable of operating in conjunction with up to 20 other intercommunication stations in any combination regardless of type. (Seefigure 1-1.)

1-3. The types of different intercommunication stations with which the LS-518A/SIC and LS-519A/SIC are compatible include the 2 station LS-458/ SIC, the 10 station LS-386/SIC, and the 20 station LS-385/SIC. In addition, remote loudspeaker stations, modified types LS-305/SIC (IC/SAA) and LS-306/SIC (IC/SAG) may be incorporated in a particular system with either the LS518A/SIC and the LS-519A/ SIC.

## 1-4. EQUIPMENT DESCRIPTION.

1-5. The LS-518A/SIC or the LS-519A/SIC, hereafter referred to as the 'master station, provides two-way voice communications by way of input/output audio devices which may be either microphones, handsets, or loudspeakers. The loudspeaker contained in the master station, which may be used for talk/listen, is the Type

LS-445/U. A receptacle is provided on the front panel which will accept either the type M-132/SIC microphone or the type $\mathrm{H}-351 \mathrm{~A} / \mathrm{SIC}$ headset. In addition to the station selector switches, MIC OR HEADSET connector, and the loudspeaker, the master station front panel contains a release (REL) lamp, CALL lamp, BUSY lamp, a HANDSFREE-NORMALPRESS TO TALK switch, a DIMMER control switch, and a VOLUME control switch for incoming loudspeaker audio.

1-6. The master station amplifier and power supply are designed with all solid state components. The amplifier has a rated output of 3 watts and is capable of driving two selected station loudspeakers simultaneously to full rated acoustic output of 99 dB sound pressure level at 2 feet. More than two stations can be called simultaneously at reduced sound output at the called stations.

1-7. The master station enclosure is designed for mounting on a bulkhead, in a panel, or on a desk and is suitable for shipboard installation in protected areas. The enclosure is aluminum and drip proof in accordance with MIL-I-983.

1-8. Each master station requires about 25 watts of primary power delivered at $115 \mathrm{~V}, 60 \mathrm{~Hz}$ nominal. See Table 1-1 for complete specifications.

## 1-9. REFERENCE DATA.

1-10. The manufacturer of the Type LS-518A/SIC and the Type LS-519A/SIC Intercommunication Stations is identified in paragraph 1-2. Table 1-1 contains nominal specifications, both electrical and environmental.

## 1-11. EQUIPMENT SUPPLIED.

## Change 1 1-1

1-12. The equipment supplied includes both the LS518A/SIC and the LS-519A/ SIC Intercommunication Stations. Except for preproduction testing; microphones, handsets, remote loudspeakers, and test equipment are not supplied. Table 1-2 provides a cross reference to crated (C) and uncrated (UC) dimensions, weight, and volume of the intercommunication stations. Dimensions are expressed in inches, weight in pounds, and volume in cubic feet.

## 1-13. EQUIPMENT REQUIRED BUT NOT SUPPLIED.

1-14. The equipment required to operate and maintain the intercommunication stations described in this chapter is listed in Table 1-3.

## 1-15. FIELD AND FACTORY CHANGES.

1-16. Table 1-4 lists each field and factory changes considered and included in the preparation of this manual.

Table 1-1. Intercommunication Stations LS-518A/SIC and LS-519A/SIC, Nominal Specifications.

| FEATURE | CHARACTERISTICS |
| :---: | :---: |
| Power Requirements | Single phase, 24.8 watts @ 0.9p.f. $115 \pm 6$ volts ac @ $60 \pm 3 \mathrm{~Hz}$., 0.24 amperes nominal. |
| Heat Dissipation | 75 BTU/HR @ full rated output. |
| Ambient Operating Temperature | $0^{\circ} \mathrm{C}$ to 650C. |
| Relative Humidity | 95\% maximum. |
| Output | 3 watts @ $5 \%$ maximum THD ( 70 volts rms into 1667 ohms). |
| Input Sensitivity | 8.7 mv into 150 ohm for mic or handset. 4 mv into 16 ohm for speaker input. |
| Amplifier Gain | 78 dB voltage gain @ 1,000z. (mic input). |
| Amplifier Frequency Response | 400 to $5,000 \mathrm{~Hz} \pm 2 \mathrm{~dB}$. |
| Rated Loudspeaker Output; $(1,000 \mathrm{~Hz})$ | 99 dB SPL (Ref. 0.0002 dynes $/ \mathrm{cm}^{2}$ ) <br> @ 2 ft . from front panel. |
| Rated Loudspeaker Input, when used as a microphone; $(1,000 \mathrm{~Hz})$ | 86 dB SPL (Ref. 0.0002 dynes $/ \mathrm{cm}^{2}$ ) <br> @ plane of front panel. |

Table 1-2. Equipment Supplied.

## CHAPTER 2

## OPERATION

## 2-1. INTRODUCTION.

2-2. This chapter describes the operator's relationship to the master station and identifies all controls and indicators which he is expected to use in the performance of his duties. In addition, illustrative material identifying the location of the controls and indicators as well as information describing normal operation and variations of operation are provided.

## 2-3. CONTROLS AND INDICATORS.

2-4. All front panel controls and indicators are illustrated on figures 2-1 and 2-2 and described below.
a. REL Indicator Lamp. This indicator lights at a calling station when a station selector pushbutton is depressed. This reminds the operator to depress the PRESS-TO-RELEASE pushbutton when the conversation is finished.
b. CALL Indicator Lamp. This indicator lights at the called station when it is selected by any other station in the system. Visually alerts operator to the incoming call.
c. BUSY Indicator Lamp. This indicator lights at the calling station when the station being selected is already busy.
d. PRESS-TO-RELEASE Switch. This pushbutton switch releases the selector pushbuttons and must be depressed following a conversation. Restores selector pushbuttons to normal position.
e. STATION SELECTOR Switch. This pushbutton switch must be depressed in order to originate a call. The LS-518A/SIC has 10 of these switches; the LS-519A/SIC has 20.
f. VOLUME Control Switch. This control is a six position rotary attenuator switch having five 6 dB steps and providing a maximum attenuation of 30 dB . Use to control the output volume of the speaker.
g. DIMMER Control Switch. This control is a four position rotary switch which controls the panel illumination. The maximum ccw position (OFF) extinguishes the lamp.
h. HANDSFREE-NORMAL-PRESS TO TALK Switch. This control is a three position rotary switch having two locking positions (HANDSFREE and NORMAL) and one position with spring return (PRESS TO TALK). The NORMAL position is used for listening.
i. MIC OR HANDSET Connector. Used to connect either a microphone or a handset to the station.
j. SPEAKER. This is a 4-inch direct type radiator which functions as either a microphone or a receiver.

NOTE
There is no power on/off switch on the master station or on any intercommunication station mentioned in this manual. Power is usually supplied and controlled from the Ships IC switchboard.

## 2-5. OPERATING PROCEDURES.

2-6. The master station has many operational features which may or may not be employed in a given intercommunication system. Those features which are necessary in any system are initiated by controls on the front panel. Features which are not always necessary are implemented by optional

Figure 2-1. Intercommunication Station Type LS-518A/SIC, Operator Controls and Indicators.

Figure 2-2. Intercommunication Station Type LS-519A/SIC, Operator Controls and Indicators.
wiring interconnections. The procedures described in paragraphs 2-7 through 2-16 delineate all possibilities.

2-7. COMMUNICATION BETWEEN TWO MASTER STATIONS. The operations necessary for communication between two master stations are described in paragraphs 2-8 through 2-10.

2-8. Originating a Call. To originate a call, depress selector pushbutton of the station desired. If BUSY indicator lights, depress PRESS TO RELEASE pushbutton and call later. If BUSY indicator does not light, operate HPNDSFREE-NORMAL-PRESS TO TALK switch to the PRESS TO TALK position and talk into speaker. To receive reply, allow HANDSFREE-NORMAL-PRESS TO TALK switch to return to NORMAL. When communication is completed, depress PRESS TO RELEASE pushbutton.

## NOTE

The master station is provided with an operational Busy Override feature which if employed will allow the calling station to hear the conversation of the busy stations. If desired the calling station may also super-impose speech signals on those of the busy stations. If this feature is desired, remove the jumper between terminals Y 6 and Y 7 of the station terminal board.

2-9. Answering a Call. To answer a call, (CALL indicator is lighted), operate HANDSFREE-NORMALPRESS TO TALK switch to PRESS TO TALK position and talk into speaker. When conversation is finished, observe CALL indicator. It should be extinguished. If lighted, instruct the calling station to depress PRESS TO RELEASE pushbutton.

2-10. Busy Override. If BUSY indication is received as described in paragraph 2-8, operate HANDSFREENORMALPRESS TO TALK switch momentarily to PRESS TO TALK. This will unlatch the busy circuit, extinguish the BUSY indicator, and permit two-way communications to begin. When the conversation is completed, depress PRESS TO RELEASE pushbutton.

2-11. PARALLEL OPERATION OF TWO MASTER STATIONS. If desired, two units may be connected for parallel operation. In this configuration the operation is the same as for a single unit with the following exceptions.
a. Incoming speech will be heard at both units.
b. Either station may answer a call but not both. (Inadvertant answering by both units simultaneously will not cut off transmission of speech to the calling units.
c. Operation of VOLUME control from either unit will control volume of both units.
d. Outgoing speech from one paralleled unit will not be heard at the unit to which it is paralleled.
e. Operation of a station selector at either of the paralleled units, in addition to lighting the CALL lamp at the called station, will cause the CALL lamp in the unit to which it is paralleled to light.

2-12. HANDSFREE OPERATION OF THE MASTER STATION. A master station which is functioning in the called condition may be switched to handsfree reply, if so desired, by operating HANDSFREE-NORMALPRESS TO TALK switch to HANDSFREE position. The unit may also be switched to the handsfree mode prior to receiving a call. Under this condition the calling station operator achieves control of the talk and listen circuits between the two stations. The operator at the called station need only talk into the loudspeaker when necessary.

2-13. HANDSFREE OPERATION WITH OTHER TYPE INTERCOMMUNICATION STATION. The master station is compatible with and may be used in an intercommunication system containing other types of stations such as the LS-458/SIC, LS-386/ SIC and LS385/SIC. The operation is similar to that described in paragraph 2-12. See Technical Manuals NAVSHIPS 0365-282-2000 for the LS-458/SIC and NAVSHIPS 0365-275-0000 for the LS-385/ SIC and LS-386/SIC.

2-14. MASTER STATION OPERATION WITH REMOTE LOUDSPEAKER STATIONS. The master station may be operated with Remote Loudspeaker Stations, Modified Types LS-305/SIC (IC/SAA) or LS306/ SIC (IC-SAG). The operations necessary for communications in this configuration are described in paragraphs 2-15 and 2-16.

## NOTE

Remote talk switches and busy indicators are not usually supplied with the aforementioned station types and therefore must be obtained and incorporated in the system per the simplified schematic shown in figure 3-7.

2-15. Master Station Calling Remote Loudspeaker Station. Perform the following operations.
a. Master station operator depresses the station selector switch pushbutton associated with the called station.
b. Master station operator then depresses PRESS TO TALK switch and speaks into loudspeaker.
c. Master station operator release PRESS TO TALK switch and waits for reply from remote loudspeaker station. Loudspeaker station operator replies without operating any switches by simply talking into the remote loudspeaker.
d. Master station operator releases station selector switch at end of call to return station to standby condition.

2-16. Remote Loudspeaker Station Calling Master Station. Perform the following operations.
a. The loudspeaker station talk switch associated with the master station being called is operated to talk position. If selected master station is busy, the loudspeaker busy lamp will light, indicating master station should not be called.
b. If busy lamp remains extinguished when talk switch is operated to talk position, master station is idle. With talk switch in talk position, speak into loudspeaker. Speech will be heard at master station.
c. After initial transmission to master station, the speaker station operator maintains talk switch in talk position. Master station replies by operating PRESS TO TALK switch.
d. If, when a master station is called by a remote loudspeaker station, master station switch is operated to select station originating call, operation will be as described in paragraph 2-15 until end of conversation.

## 2-5/(2-6 blank)

## CHAPTER 3

## FUNCTIONAL DESCRIPTION

## 3-1. INTRODUCTION.

$3-2$. This chapter includes the detailed analysis of the principles of operation of the master station. The analysis, which begins at the overall level, progresses systematically through the major functional level and finally to the detail descriptions of the individual circuits. Functional block diagrams and simplified schematics are the prime means of communication and the text is used to support the diagrams as necessary for clarity.

## 3-3. OVERALL FUNCTIONAL ANALYSIS.

3-4. Two master stations, illustrated in block diagram format, are shown on figure 3-1 in a simplified 2 station hookup. Before proceeding into the functional analysis, note the following:
a. The audio signal path between the 2 stations is implemented by a pair of conductors which carries the audio at a nominal 70 volt level in either direction.
b. The block labeled T/R Xfmr (1T1) represents a multiple winding audio transformer which couples the audio signal in either of two directions depending on whether the station is transmitting or receiving a communication.
c. The circles labeled 2, 2C, and 2 X are interconnection wiring points on the "calling" stations' terminal board which in this case are associated with station selector switch S2. 3, 3C, and 3X through 21, 21C, and 21 X are not shown but are associated with selector switches S3 through S21 respectively.
d. The circles labeled 1, 1C, and 1X are the interconnection points on the "called" stations' terminal board.
e. Both stations no. 1 and no. 2 are identical master stations, but only the necessary blocks are shown to illustrate the overall functions.

3-5. A communication path, originating from station no. 1 is established to station no. 2 when S 2 is depressed providing station no. 2 is not busy.

In addition, the operation of S2 will cause the REL lamp, at the calling station, and the CALL lamp, at the called station, to light. The station no. 1 operator then depresses the PRESS TO TALK switch and speaks into the speaker. This transmission is coupled by way of the "talk relays" and S26A to the audio amplifier input where it is amplified. The amplified transmission is then coupled by the T/R Xfmr, to the outgoing trunk. The incoming trunk at station no. 2 receives the transmission and by way of $T / R$ Xfmr passes the signal through the volume control and talk back relays to the speaker. Operator no. 2 responds to the received message by operating the PRESS TO TALK switch and speaking into the speaker. This transmission is amplified and coupled by way of the incoming trunk to the 70 volt audio pair and subsequently coupled through the designated path to the speaker of station no. 1.

3-6. In the event that station no. 2 is already busy when the station no. 1 operator depresses the selector switch, the busy relays at station no. 1 will energize and disconnect the outgoing trunk from the T/R Xfmr. In this case, the BUSY lamp will light thus notifying the operator that a transmission cannot be made at this time. He should then depress the PRESS TO RELEASE switch and call later.

3-7. MAJOR AND CIRCUIT FUNCTIONAL ANALYSIS.

Figure 3-1. Overall Block Diagram.

3-8. The following paragraphs provide the analysis for the operation of the blocks shown on figure 3-1. Simplified schematics as well as block diagrams are provided. In some instances reference to the overall schematic [figure (5-3) is suggested. Conventional electronic circuits and theory are described in NAVSHIPS publication 0967-0000120, For a more thorough understanding of the circuits utilized in the master station audio amplifier and power supply the following topics are recommended.
a. General information on semiconductor circuits.
b. Power supply circuits.
c. Voltage regulator circuits.
d. Amplifier circuits.

3-9. It is further recommended that the following military publications which detail the specific semiconductor types utilized (all are silicon) be reviewed for information regarding their parameters:
a. MIL-S-19500/225, Transistor, NPN, 2N1711
b. MIL-S-19500/407, Transistor, NPN, 2N3055
c. MIL-S-19500/290, Transistor, PNP, 2N2905A
d. MIL-S-19500/251, Transistor, NPN, 2N2219A
e. MIL-S-19500/276, Thyristor, SCR, 2F2323
f. MIL-S-19500/286, Diode, Power, 1N4245
g. MIL-S-19500/240, Diode, Signal, 1N645

3-10. POWER SUPPLY AND 22 VOLT REGULATOR. All necessary ac and dc operating voltages for the master
station are provided by the power supply and 22 volt regulator as shown on figure 3-2. The 16 VAC and the 6 VAC outputs are utilized for the signaling and illumination circuits respectively. The +26 VDC output is supplied to the relay control circuits and the 22 volt regulator by way of the talk relay K3. During audio transmission, the +22 VDC regulated output is connected to the audio amplifier collector circuits. In the event that the outgoing trunk is overloaded, transistor Q4 will conduct and significantly reduce the reference voltage at the input of Q3. Q3 output current is therefore reduced and subsequently the output current of 1Q3 is limited. Refer to figure 5-3 for the overall schematic diagram.

3-11. AUDIO AMPLIFIER. The audio amplifier contained in the master station is all solid state design and is illustrated on figure 3-3. In the standby condition, the 22 volt regulator is off, the amplifier is de-energized and diodes CR4 and CR5 isolate 1T1 (winding 1-2-3) from the amplifier output circuitry. In this receiving mode, audio from the incoming trunk appears at the 70 V input terminals (7-8) of 1 T 1 and is coupled to terminals 4-5-6.

3 -12. In the ready, or transmit, mode the regulated +22 volts is applied and the amplifier is energized. This mode is accomplished by operating S26, to the PRESS TO TALK position. In this condition, low level speech signals from either the local microphone or transducer are coupled by input transformer T1 to the preamplifier (Q1) for initial amplification. The signal is further amplified by Q2 and coupled by driver transformer T2 to the pushpull 3 -watt output stage consisting basically of 1Q1, 1Q2, and 1 T 1 . The 70 V output, from terminals $7-8$ of 1 T 1 , is transferred by the contacts of $x 8$ to the outgoing trunk. Refer to the overall schematic diagram (figure 5-3 and the applicable chapter of NAVSHIPS publication 0967-000-0120.

Figure 3-2. Power Supply and 22 Volt Regulator, Block Diagram.

Figure 3-3. Audio Amplifier, Block Diagram.

3-13. SIGNAL CIRCUITS. A signal line designated 2 X , $3 \mathrm{X}, 4 \mathrm{X}, 5 \mathrm{X}$ etc. is assigned to each station. (See figure 3-4.) When a station selector switch is operated, the signal line selected is momentarily connected to the gating network of Q2 due to the action of the delayed cam switch S23. If the selected station is busy, relays K7 and K8 will latch in the operated position and the BUSY lamp (DS3) will light.

The audio circuit is thus disconnected by K8. If the selected station is not busy, K7 and K8 will not operate, the audio circuits between the two stations will be connected and the CALL lamp (DS2) will light at the selected station. In addition, the signal lines of both stations will be connected to the signal common lead resulting in a busy signal at any third station attempting to call either of the two connected stations.

3-14. Station No. 1 Calling Idle Station No. 2. To trace the operation of the signal circuits, refer to figure 3-4 Power transformer T2 has two windings (6VAC and 10VAC) connected in series to provide a total of 16 volts ac. Terminal 5 , which is designed as the ac common, is connected by way of a 10 -ohm resistor (R1), to XX (the common signal line). The high side, 16 volts ac from T24 , is distributed to S26, S27, and K7/K8. When a station selector is operated, the gating network of Q2 will be momentarily connected by S 23 to the 2X/1IX signal lead. Since station no. 2 is idle, the potential reflected back is the same as T2-4 and, therefore, Q2 does not fire and K7/K8 do not energize.

However, where the swinger contact of S 23 returns to the normal position (as shown) the potential from T2-5 is connected by way of S26, K4, S23, and S2 to the $2 \mathrm{X} / 1 \mathrm{X}$ signal lead and the CALL lamp (DS2) at the idle station will light.

3-15. Station No. 1 Calling Busy Station No. 2. Assume that a third station has selected station no. 2 and,
therefore, terminal 1 X at station no. 2 is at the T2-5 potential. When station no. 1 attempts to contact station no. 2, the momentary closure of S23 will trigger Q2 and energize K7/K8 which operate and lock through CR5 and S1. Station no. 1 is thus disconnected from the 70 volt audio pair by the contacts of relay K8.

3-16. Delay switch S23 operates when any selected pushbutton is depressed. To assure adequate time for K7 to close and lock on a busy line, the circuit through the delay switch S23 remains closed until the slider bar returns to its normal position. The swinger contact of this switch is actuated by the end projection of the slide bar and is adjusted at the factory to delay the opening for a minimum of 50 milliseconds.

3-17. PARALLEL OPERATION. Two master stations may be connected in parallel as shown, for stations 3 and 3A, on figure 3-5. Incoming speech will be heard at both stations and replies may be made from either station. Either station can call a third station, but both stations cannot call at the same time.

3 -18. Incoming speech, from the 70 volt audio pair, appears at terminal 7-8 of transformer 1 Ti at both stations 3 and 3A. In this condition, IT1 which functions as a line-to-speaker matching transformer, couples the speech signal to the volume control and contacts of K4. Note that K4 of station no. 3 controls one side of the speech signal for station no. 3A and K4 of station no. 3A controls one side of the speech signal for station no. 3. Therefore, K4 functions as a muting relay to prevent acoustic feedback when either no. 3 or no. 3 A is transferred to the transmitting, or PRESS TO TALK, mode by the operation of S26B. (See figure 3-7 for a more detailed presentation of relay circuits K2, K4, and K6.)

3-19. HANDSFREE OPERATION. Fiqure 3-6 illustrates the circuitry involved

Figure 3-4. Signal Operation, Simplified Schematic.
in handsfree operation of the master stations. On this illustration, station no. 1 is shown as the calling station and station no. 2 as the called station operating in the handsfree mode. Under these initial conditions, Q1 of the called station is conducting and K 3 and K 4 are energized. The audio amplifier and audio circuits of station no. 2 are thus energized and speech may be transmitted handsfree from station no. 2 to station no. 1. (See figure 3-7 for a more detailed presentation of the audio circuits.)

3-20. To transmit from station no. 1 to station no. 2, S26B of station no. 1 is operated to the PRESS TO TALK position. In this condition, Q1 of station no. 2 turns off, K3 and K4 are de-energized, and station no. 2 is placed automatically in the normal receive mode.

Simultaneously, the audio amplifier at station no. 1 is energized and speech may be transmitted from station no. 1 to station no. 2.

3-21. The basic handsfree control function revolves around the emitter circuit of Q1 which is normally biased off by R17 when S26 is in the NORMAL position. When S26 is operated to the HANDSFREE position, the anode of CR3 is returned to the +26 Vdc lead potential and forward bias is provided to the base of Q1 by the voltage divider comprised of R16 and R15. Remote control of Q1 is accomplished by the normally closed contacts ( 6 and 8 ) of K4 and resistor R21. Removing the short from across R21 results in a sufficiently higher emitter impedance to turn Q1 off.

## STATION N0. 3

Figure 3-5. Parallel Operation, Simplified Schematic.

3-22. REMOTE LOUDSPEAKER OPERATION. Remote stations consisting simply of loudspeakers, talk switches, and busy indicators may be incorporated in an intercommunication network with either of the master stations described in this manual. However, certain wiring modifications within the master station are required in order to isolate remote master stations. Figure 3-7 illustrates the necessary wiring modifications for interconnecting one remote loudspeaker station to selector switch S21 of the LS-519A/SIC master station. With the wiring as shown on figure 3-7, two way voice transmissions are feasible and may be initiated from either the master station by depressing S21 or from the remote loudspeaker station by operating the PRESS TO TALK switch. If desired, additional remote loudspeaker stations may be employed by simply isolating the proper selector switches. See the overall schematic diagram (figure 5-3) and the wiring diagrams (figures 6-1] and 6-2).
$3-23$. Relays K5 and K6 (figure 3-7) control the input/output functions of the audio amplifier and are shown in the de-energized (receive) state. Operation of either the local select switch S21 or the remote talk switch will energize K1, K2, K3 and K4 and place the audio amplifier in the ready condition. In this mode, voice transmissions made into the loudspeaker are amplified and reproduced over the master station loudspeaker. To reply, the master station operator depresses switch S26 to the PRESS TO TALK position. In this mode, the talk back relays (K5 and K6) are energized and voice transmissions made into the master station speaker (LS1) will be amplified and reproduced over the remote loudspeaker.

3-24. If a communication is initiated from the master station, the remote operator replies handsfree. If the communication is initiated from the remote loudspeaker station, the remote talk switch must be maintained in the $3-8$ talk position to receive the reply from the master
station, unless the master station operator operates the selector switch for the calling stations.

## 3-25. PUSHBUTTON SELECTOR SWITCH

 OPERATION. The pushbutton selector switch assembly is shown on figure 3-8. Two of these assemblies are utilized in the LS-519A/SIC and one is used in the LS518A/SIC. In the standby condition, the release pushbar is depressed and all the select pushbars are released (out). The release push-bar is held in the depressed position by the slide-bar. The lift-bar is held in a raised position by a metal cam integral with the release pushbar assembly.$3-26$. Depressing any select push-bar will momentarily move the slide-bar to the left (viewed from front). This allows the compression spring to actuate the release push-bar to the nonoperated position (out). The integral cam on the release push-bar also moves from under the lift-bar and the liftbar is then pulled down by its spring. The select pushbar is held in the operated position by means of lock springs which rest on the rear surface of the lift-bar. The second select push-bar may now be depressed without raising the lift-bar from its down position because of the slots in the lift-bar which allow the lock springs to pass through.
$3-27$. As each select push-bar is depressed, the delay switch is momentarily operated by the slide bar. When the release push-bar. is depressed, the slide-bar moved to the left and the lift-bar is raised, allowing each spring on a depressed select push-bar to restore its push-bar to the normal (out) position. The shock-bar, which is located on the left end of the pushbutton selector switch assembly, inhibits movement of the slide-bar under mechanical shock conditions. This prevents false operation of the select push-bars.

## CHAPTER 4

## SCHEDULED MAINTENANCE

## 4-1. INTRODUCTION.

4-2. This chapter contains the preventive maintenance procedures and performance test instructions to be accomplished on the master station periodically. The purpose of scheduled maintenance is to prevent failures and prove that the equipment is in specified working order. The scheduled maintenance instructions in this manual are canceled when the Planned Maintenance System (PMS) is implemented for this equipment aboard your ship or station.

## 4-3. SCHEDULED PREVENTIVE MAINTENANCE PROCEDURES.

4-4. The following procedures should be performed on a monthly basis or as directed by the ship's maintenance supervisor.
a. Clean the exterior of the equipment. Loose dirt may be removed with a vacuum cleaner or cloth. Dirt adhering should be removed with an approved solvent and cloth.
b. Remove the unit from its case and visually inspect all wiring. Watch for loose connections. Do not unnecessarily move wiring or parts. Resolder or tighten as required.

WARNING
The terminal board in the case has 115 volts ac on terminals MC and MCC. Turn off power source during inspection.
c. Inspect and tighten all loose hardware.
d. Check the mechanical operation of each rotary switch and replace any parts showing wear or incorrect operation.
e. Check each pushbutton switch for smooth mechanical operation. Clean dirt off shafts and lightly lubricate with Dow Corning DC4 grease or DC400 fluid or equivalent.
f. Install unit in its case and perform the operations described in paragraph 4-5.

## 4-5. SCHEDULED PERFORMANCE TEST INSTRUCTIONS.

4-6. The following performance tests should be accomplished on a weekly basis or as directed by the ship's maintenance supervisor. It is recommended that close cooperation be maintained between operating and maintenance personnel. Each should keep the other informed on the condition of the equipment.
a. Check the two-way voice capabilities of each master station by selecting other stations in the system and carrying on two-way conversations. Transmissions and receptions should be clear, undistorted, and easily understood.
b. Check the indicators. The CALL lamps at the called stations should light. The REL lamp at the calling station should light. If a called station is busy, the BUSY light at the calling station should light.
c. Check the VOLUME control switch. Vary its position during a reception to verify that the intensity of the received speech can be controlled.
d. Check the handsfree capability by operating handsfree with another station in the system.
e. Check the DIMMER control switch by varying its position and observing the intensity of the panel illuminat ion.

## 4-7. MALFUNCTIONS.

$4-8$. In the event that the preventive maintenance procedures, or the performance test instructions reveal
one or more malfunctions.. it is recommended that the unit under investigation be replaced by a serviceable unit. The tests should then be repeated to verify that the problem is definitely associated with the removed unit. Refer to Chapters 5 and 6, Troubleshooting and Corrective Maintenance respectively, to isolate and repair the malfunction.

## CHAPTER 5

## TROUBLESHOOTING

## 5-1. INTRODUCTION.

$5-2$. This chapter contains the information required to enable the technician to localize and isolate malfunctions in the master station. The information, which is presented, appears in various related formats such as tables, procedures, schematics and wiring diagrams. In addition, references to pertinent information contained in other chapters are also provided. Close cooperation is again recommended between operating and maintenance personnel because information which can at least localize a problem may already be available. Also review the results of the procedures and tests outlined in Chapter 4 for data which may be useful in isolating the fault. Generally, observe the following:
a. If sufficient information is available which localizes the problem to a functional area, refer directly to table 5-1, Troubleshooting Index, and review the applicable data.
b. If sufficient information is not available, refer to table 5-4 Maintenance Turn-On and Test Procedure and localize the malfunction. The test fixture required is illustrated on figure 5-1.

WARNING
Operation of this equipment involves the use of voltages which are dangerous to life.

Proceed with caution when troubleshooting in areas where live circuits are exposed. Do not service or make adjustments without the immediate presence or assistance of another person capable of rendering aid.

## 5-3. TROUBLESHOOTING INDEXES.

5-4. Troubleshooting reference data, presented in convenient tabular format, are provided in tables 5-1 5-2. and 5-3 for functional areas as well as relays, lamps, and protective devices. Table 5-1 relates functional areas, such as the audio amplifier or signal circuits, to the associated troubleshooting paragraphs and diagrams. Table 5-2 identifies all relays and lamps and gives their rated energizing voltages. Table 5-3 identifies the protective devices such as fuses and semiconductors.

5-5. Always refer to the applicable index whenever a malfunction in the master station is encountered and remember that fuses, lamps, and electromechanical devices are inherently more likely to fail than solid state components. Schematic diagrams are located at the end of this chapter, wiring diagrams are located in Chapters 6 and 8. Parts location diagrams are located in Chapter 7.
5-6. MAINTENANCE TURN-ON AND TEST PROCEDURE.

5-7. If a master station is thought to be defective, but the exact symptoms are not known, refer directly to table 5-4 and utilize the test fixture (figure 5-1) to localize and define the problem. Table 5-4 provides a step by step process with observations and some references to related information in other parts of the manual. However, once the symptoms are recognized refer either to the troubleshooting indexes (tables 5-1 through 5-3] or go directly to the appropriate troubleshooting paragraph and isolate the defective part.

## 5-8. GENERAL TROUBLESHOOTING PROCEDURES.

5-9. The primary power input circuits (MC and MCC) of all the master stations in an intercommunication system are connected in parallel from the ship's IC switchboard. If the entire system is inoperative the trouble is obviously in the primary power source. However, if one master station in the system is inoperative, its primary power fuses may be open. Inspect the panel illumination of the faulty unit. If power is available and the fuses, (which are internal) have not failed, the panel should be illuminated. If not, remove the panel/chassis assembly from the case and check the fuses. Replace open fuses at least once, using fuses of proper rating and replace the unit. If the
fuses fail again, do not replace a second time until the cause has been corrected. Remove the faulty panel/chassis assembly and substitute a good unit.
Checkout the good unit by performing the tests described in Chapter 4, paragraph 4-6. Refer to paragraph 5-6 and utilize the test fixture and the procedure (outlined intable 5-4 to check out the faulty unit.

## 5-10. POWER SUPPLY AND 22 VOLT REGULATOR.

5-11. The power supply and 22 volt regulator circuits are shown in detail on the overall schematic diagram (figure 5-3). Typical voltages (under no audio signal conditions) are listed in
table 5-5. The test setup is illustrated or figure 5-2 Before energizing a unit suspected of having a faulty power supply, visually inspect the components for discoloration, blistering, broken leads, etc. Replace or repair any defective parts before proceeding. Using a multimeter, measure the resistance from A3-14 to A3-13. Unless A3C14 or A3R1 are faulty, the meter should read approximately 1350 ohms. If this resistance is obtained, it is relatively safe to apply 115 volts ac to the unit. Turn on the PTT switch in the test setup. Measure the various voltages and compare the results to the nominal (no signal) values listed in table 5-5. Isolate and replace suspected or fault components. Refer to NAVSHIPS publication 0967-000-0120 for theory and operation of similar power supply circuits.

## 5-12. AUDIO AMPLIFIER.

$5-13$. The audio amplifier circuitry is shown in detail on the overall schematic diagram figure 5-3). Typical voltages and audio levels are listed intable 5-6. Refer to figure 5-2 for the test setup. Energize the unit (operate the PTT switch to ON) and make the measurements. Compare the results to the values listed in table 5-6 and replace any suspected or faulty components. Refer to table 1-1 for electrical characteristics of the amplifier. Refer to NAVSHIPS 0967-0000120, pages 6-B-1 through 6 -B-9 for theory and operation of similar amplifier circuits.

## NOTE

Ac voltages are nominal Rms signal levels at various stages when the
amplifier is connected in accordance with the test setup in figure 5-2. Dc voltages are nominal no signal values.

* On equipments with serial numbers 1 through 499, R16 in the emitter circuit of 1A3Q2 is a fixed resistor. For all other equipment serial numbers, R16 is a variable resistor which is adjusted for 70 volts output with a 8.7 millivolt microphone signal input. R16 is adjusted during production and whenever 1A3Q1, 1A3Q2, 1A3Q3 or 1A3Q4 are changed.

## 5-14. SIGNAL CIRCUITS.

$5-15$. The components involved in the functions of the signal circuits are best illustrated in figure 3-4. This simplified schematic clearly depicts the signal circuits and should be used initially for the analysis of the malfunction. However, once the inter-relationship of components is understood and the task for isolating the faulty part remains, utilize figures 5-3, 6-1 or 6-2, and 7-5 for locating the various parts and their circuit tiepoints.

5-16. Indicators DS1, DS2 and DS3 should be checked initially without removing the panel/chassis assembly from the case. If these lamps are not faulty, it is most likely that the problem may be associated with dirty or open contacts in the pushbutton or rotary switches. Remove the malfunctioning panel/chassis assembly from the case and make continuity checks of the switch circuits with a multimeter. Except for S23 or S24 (delay switches) all contacts are either open or closed depending on the position of the respective actuator. With regards to S23 or S24, contacts 1-2 should be closed except during the short interval when a select pushbutton is initially depressed. During this interval contact 2 must make with contact 3 for at least 50 milliseconds.

5-17. After the switches have been eliminated as a possible source of malfunction, apply 115 volts ac to the unit and verify that the secondary voltages of T2 are normal. (See table 5-5.) Also check relays A2K7 and A2K8 early in the troubleshooting process by substituting a known good equivalent. Observe that these relays have 18 volts dc coils and all others have 26 volts dc coils.
$5-18$. If the aforementioned process does not reveal the problem, investigate the busy sense circuit (A2Q2) and the latch circuit (A2CR7). With 115 volts ac applied and any select pushbutton depressed, momentarily jumper terminals 2 to 3 of delay switch S23. A2Q2, which is a silicon controlled rectifier operating in a halfwave rectified circuit, should conduct (the gate momentarily has the same polarity as the anode). In addition, the BUSY indicator DS3 should light and A2K7 should energize and latch through contacts 1-6 and A2CR7. Isolate the
faulty component and replace it. Perform step 6 of table $5-4$ to verify that the fault has been corrected.

## 5-19. PARALLEL OPERATION.

5-20. The components and the interconnections involved in parallel operation of two master stations are shown on figure 3-5. Troubleshoot initially by making continuity checks of S25, S26B, and the wiring between the two stations. Check relays A2K2, A2K4, and A2K6 by the substitution method since these relays are sealed and cannot be adjusted. Refer to table 5-6 for the normal audio signal voltages on transformer 1T1.

## 5-21. HANDSFREE OPERATION.

5-22. The components involved in the functions of the handsfree circuits are best illustrated on figure 3-6. Examine this simplified schematic and note the path of the control signal. Then, refer to figures 5-3, 6-1 or 6-2 and 7-5 and make continuity checks of the control signal path through the switches and wiring between the two units. Determine which master station is at fault and check relays A2K2, A2K3 and A2K4 by the substitution method since these relays are sealed and cannot be adjusted.

5-23. Under the conditions shown on figure 3-6. station No. 2 is operating handsfree and A2Q1, a PNP transistor operating in the switching mode, is conducting. In order for station No. 2 to receive an audio transmission from station No. 1, A2Q1 must be turned off by sufficiently increasing the emitter impedance. This function is normally accomplished when A2K4 in station No. 1 energizes and A2R21 is unshorted. Investigate this function and replace the faulty component(s). Utilize a multimeter and the test fixture if desired. Refer to step 8 in table 5-4.

## 5-24. REMOTE LOUDSPEAKER OPERATION.

5-25. The components involved in the function of the remote loudspeaker are best illustrated on figure 3-7. This simplified schematic also shows many other functions and is useful for troubleshooting the relay and push-to-talk circuits. Malfunctions in the remote loudspeaker circuit are most likely to be either faulty select switches or relays. Continuity check switches and interconnection wiring between the master and the remote loudspeaker stations. Replace any suspected or faulty relays.

## NOTE

Diodes A2CR4, A2CR5, and A2CR6 are not shown on figure 3-7 but are necessary for suppressing the deenergizing transients of the relay coils. (See figure 5-3.) If an ohmmeter is used to measure the coil resistance when the relays are plugged into their sockets, connect the test leads such that the polarity back biases the diode. The normal dc resistance of each relay coil is $\mathbf{6 7 5}$ ohms.

## 5-26. PUSHBUTTON SELECTOR SWITCH ASSEMBLY.

5-27. Malfunctions which may occur in the pushbutton selector switch assembly could be either mechanical or electrical. If the problem is electrical, determine which switch is malfunctioning. Refer to the overall schematics and wiring diagrams figures 5-3, 6-1, and 6-2) and make continuity checks of the suspected switch. Clean and adjust if necessary.
$5-28$. If the problem is mechanical, its most likely to be a condition of dirty or gummy parts or a lack of proper lubrication or adjustment. Examine the operation of the mechanical parts while depressing the pushbuttons. Refer to Chapter 6 for corrective maintenance and lubrication.

$\frac{\text { NOTES: }}{1 .}$

- LINE VOLTAGE: $115 \mathrm{~V}, 60 \mathrm{~Hz}$, A.C.

2. POLARITY: WITH MC CONNECTED TO XX, VOLTAGE FROM MCC TO Y7 is greater than the 3. INPUT POWF.R: A. STANDBY: B. OPERATING: 7.5 WATTS

## CHAPTER 6

## 6-1. INTRODUCTION.

6-2. This chapter contains the necessary instructions for repairing the master station after a malfunction is located using the troubleshooting routines described in Chapter 5. There are no special tools required for making electrical or mechanical repairs and the only adjustments which may be necessary are associated with the pushbutton selector switch assembly.

6-3. The master station parts location diagrams are located in Chapter 7. Figures 7-1 through 7-5 are for the LS-518A/SIC and figures 7-6 7-7 and 7-8 are for the LS-519A/SIC. Any references to item numbers in the following paragraphs relates to these figures.

## 6-4. REMOVAL.

6-5. To remove the panel/chassis assembly from the case, loosen and remove the four slotted hex-head screws (item 72). Grasp the handles and pull the panel/chassis assembly out of the case and place unit on the workbench. The chassis is hinged to the panel and may be opened for accessibility by removing the upper slotted hex-head screws on the sides. In this configuration the lower screws need not be removed.

## 6-6. ADJUSTMENTS.

6-7. PUSHBUTTON SELECTOR SWITCH ASSEMBLY. Loosen four screws, and remove cover (item 48). Upper set of contacts and mechanical motion of switch may be inspected without further disassembly. To inspect lower set of contacts, remove screws and carefully lift switch out of frame, as far as cable slack will allow and perform the operations described in paragraphs 6-8 through 6-11.

## CORRECTIVE MAINTENANCE

6-8. Leaf Switch Adjustment. Operate switch and adjust contacts on upper and lower pile-ups, as required. Refer to figure 5-3 for correct positioning of contacts in the normal and operated positions.

6-9. Leaf Switch Replacement. To replace either upper or lower switch pile-ups remove two screws and associated hardware.

6-10. Delay Switch Adjustment. The delay switch (S23 or S24) is operated by an insulated projection on the slide-bar, when the slide-bar moves laterally, and remains closed during the slide-bar cycle. If for any reason, either inadvertently or through damage, this cycle of operation has changed, the closing and opening sequence can be restored to the original factory adjustment by carefully bending the spring blades by the usual relay adjustment techniques.

6-11. LUBRICATION. Lights lubricate working parts of the switch mechanism as described below. Use low temperature instrument grease (specification MIL-G15793).
a. Lubricate roller cam surface on which lateral slide-bar moves, lift cam on release-bar, and lateral cam on each of ten station selector bars. Also lubricate portion of eleven selector bars which protrude beyond front of frame, and rear portion of each bar where it rides in slot in switch mounting plate.
b. On the pushbutton assembly, work pushbutton back and forth. Motion should be smooth and free from binding. If motion is stiff, or there is evidence of water entrance, replace and lubricate rubber 0 -ring.
c. To remove rotary switch S25, S26 or S27, remove roll pin and slip knob off shaft. Remove nut and lockwasher from front panel and remove switch from rear.

When reinstalling or replacing switches S25, S26 or S27, be sure orientation lug on switches engages locating hole in casting. Nut should be tightened enough to insure waterseal of O-ring supplied with each switch.

## 6-12. PARTS INSPECTION AND TEST.

6-13. RESISTORS. Defective resistors can be detected in several ways. A resistor which has been overloaded will become discolored and give off noticeable odors. With the power off, ohmmeter readings across a resistor will reveal resistors that are open or have changed in value. When checking in this manner, refer to the appropriate circuit schematic diagram to determine if other components in parallel with the resistor will affect the measured resistance. In this case, it will be desirable to disconnect one end of the resistor when making these resistance checks. Overloaded resistors are often caused by short capacitors. Check all capacitors in the circuit before replacing resistors.

6-14. CAPACITORS. Capacitors can be checked with the power off. A short-circuited or leaky capacitor is indicated by low resistance. An ohmmeter reading of infinity or very high resistance will be obtained if the capacitor is good or if it has a broken internal lead. A capacitor which gives an ohmmeter reading of infinity and is suspected of being open should be temporarily replaced and the effect of its substitution on voltage checks and operation should be checked. When a coupling capacitor between amplifier stages opens, the amplifier is blocked or does not produce any sound. Check the suspected capacitor by shunting a capacitor known to be good across it and note the effect.
$6-15$. DIODES. If operation indicates that a diode is defective, disconnect one lead. Check that diode measuring the front to back resistance ratio. The ratio should be at least 100 to one.

6-16. TRANSISTORS. If testing indicates a transistor stage is probably defective, check the transistor by one of the following methods.
a. A reliable in or out of circuit transistor test set.
b. By substituting a transistor known to be good.

6-17. SWITCHES. Switches can be checked with the power on by measuring the voltage at the switch terminals. With the power off, continuity checks can be made between switch terminals to determine proper operation.

6-18. RELAYS. All relays in the master station have two-pole, doublethrow contacts. The coils of A2K1 through A2K6 are rated at 26.5 volts dc, 675 ohms. The coils of A2K7 and A2K8 are rated at 18.0 volts dc, 300 ohms. Check suspected faulty relays by applying voltage to the coil and making continuity checks of the contacts or by substituting a relay known to be good.

## 6-19. PARTS REPLACEMENT.

$6-20$. Because of the compact design of the master station, it is important to use a soldering iron that is small enough to avoid damage to adjacent wiring when replacing any part with soldered connections. To replace a defective part, proceed as follows:
a. Mark, or make a chart of, the connections of the defective part that is removed.
b. Unsolder the connections to the defective part, removing all excess solder from the remaining wires or terminals that are unsoldered.
c. Replace the defective part with a new part.
d. Resolder the connections, using only resin-core
e. Verify proper connections by reference to the wiring diagram (figure 6-1 or 6-2). solder.

## CHAPTER 7

## PARTS LIST

## 7-1. INTRODUCTION.

7-2. This chapter contains lists and illustrations which identify the replaceable parts of the LS-518A/SIC and LS-519A/SIC Intercommunication Stations.

## 7-3. LISTS OF MAJOR UNITS.

7-4. Tables 7-1 and 7-2 list the major units of the LS518A/SIC and LS519A/SIC Intercommunication Stations, respectively. The tables list the major units in numerical order and provide a cross reference to Military type and part number of each unit.

The page number on which the parts listing for each unit begins is also listed.

## 7-5. PARTS LIST.

7-6. Tables 7-3 and 7-4 list the parts of the LS518A/SIC and LS-519A/ SIC Intercommunication Stations, respectively. The parts list are arranged alphanumerically by unit number and reference designation, and numerically by item number on the associated illustrations. Those items in the parts lists which have no reference designation are keyed by the letters NRD (no reference designation) in the REFERENCE DESIGNATION column. However, the progressive listing of these parts is still numerical per item number.

## 7-7. COMMON ITEM LIST.

7-8. Identical parts that are used more than five times in the equipment are listed in table 7-5. These items are referenced by item number in the parts lists; for example, the entry "Item 1 " in the NAME AND DESCRIPTION column of a parts list refers to item 1 in table 7-5. Common items are listed alphanumerically.

## 7-9. ATTACHING HARDWARE.

7-10. Items of attaching hardware used in five or more applications are listed in table 7-6. These items are identified by a letter code (A, B, C, etc.) which is used to key the hardware items to the "used on" items in the parts lists. For example, $A(6), B(6)$ would indicate that six each of attaching hardware items $A$ and $B$ are used to attach the item in the parts list with which the code is associated. Hardware items used fewer than five times are listed in the parts lists.

## 7-11. LIST OF MANUFACTURERS.

7-12. Table 7-7 lists the name, address, and Federal supply code number of all manufacturers supplying items for the equipment. Code numbers are in accordance with Handbooks $\mathrm{H} 4-1$ and $\mathrm{H} 4-2$.

Table 7-1. Intercommunication Station LS-518A/SIC, List of Major Components.

7-13. PART NUMBER CROSS REFERENCE INDEX FOR LS-518A/SIC AND LS-519A/SIC.
a. This Cross Reference Index is arranged in alphanumeric sequence order of part numbers.
b. To locate an item in the Index proceed as follows:
(1) Determine the required part number in chapter 7 of the Technical Manual.
(2) Locate the part number in the alphanumeric sequenced index to determine the National Stock Number and Source Maintenance and Recoverability code assigned.

Table 7-9. Part Number Cross Reference Index For LS-518A/SIC And LS-519A/SIC

## CHAPTER 8

## INSTALLATION

## 8-1. INTRODUCTION.

8-2. The LS-518A/SIC and LS-519A/SIC Intercommunication Stations are designed for either bulkhead, desk, or panel mounting. (See figures 8-1 and 8-2.) The units are wired in parallel to the primary power supply and wired together by the inter-unit cable as shown on figure 8-3 or 8-4. All ships cable (TTSU and DSGU) connections to the units are solder type connections.

## 8-3. TOOLS AND TEST EQUIPMENT REQUIRED.

8-4. The tools and test equipment required to install the LS-518A/SIC and LS-519A/SIC Intercommunication Stations are listed in table 8-1.

## 8-5. SITE SELECTION AND PREPARATION.

8-6. The proper location of each intercommunication unit will be specified in ship's plans. Mark the exact location of each unit. Cover the markings with transparent tape so they do not become obliterated prior to final site preparation and placement of units.

## 8-7. UNPACKING AND HANDLING.

8-8. Each LS-518A/SIC and LS-519A/SIC is individually packed in a fiberboard carton. To unpack, place carton in an upright position, slit tape on top and open. Remove top, side and end fillers. Grip handles on unit and lift out. Check unit for any external

Change 1 8-1
damage which may have been incurred during shipment. Notify the manufacturer paragraph 1-2 immediately if there is a discrepancy in equipments received and equipments listed on the shipping order.

## 8-9. POWER REQUIREMENTS AND DISTRIBUTION.

8-10. Each intercommunicating unit must be connected to ship's 115 V 60 Hz single phase power at the IC switchboard. Power requirements are listed in table 1-1.

## 8-11. INSTALLATION REQUIREMENTS.

8-12. REMOVAL OF FRONT PANEL. Before a unit can be connected to ship's wiring, the front panel/chassis assembly must be removed. Back off the four assembly bolts until the threads disengage. Remove bolts from front panel holes. Place the unit on a bench, back of case down, grasping the handles near the top of unit and pull upward slowly. The complete assembly will slide out of the case. It should be placed back in the packing case for protection until needed.

8-13. DRESSING OF SHIP'S CABLE. Care must be taken after the multiconductor ship's cables TTSU and DSGU are soldered to the terminal boards on the back of the case, that the wires are dressed properly. The wires should be dressed between the terminal boards and the terminal tube entrances and close to the surfaces of the case. This is to insure that no part of the chassis panel assembly will rise on or catch any of the cable wires when it is reinstalled in the enclosure.

## 8-14. MOUNTING OF UNITS.

8-15. MOUNTING ON BULKHEAD. Mounting details for both intercommunicating units LS-518A/SIC and LS519A/SIC are incorporated on the outline drawing (figure 8-1.

8-16. MOUNTING IN PANEL. The method of mounting the intercommunicating units in a panel is shown on figure 8-2. The dimensions of the required cut-out in the panel, and the mounting holes, the angles, and hardware to be added to the case are also shown in detail.

8-17. TERMINAL TUBES. Ship's cable may enter through terminal tubes at either the top or bottom of the case. Remove the terminal tube closures from the selected side and discard them. Install terminal tubes through the top or bottom of the case as follows:
a. Type LS-518A/SIC: One side 2 and one size 5 .
b. Type LS-519A/SIC: One size 2 and one size 5.

## 8-18. INSPECTION.

8-19. Before replacing front panel chassis, check all cable connections for accuracy, good soldered joints, condition of insulation, and proper dress within the case. Electrical and operational tests are then to be made in accordance with the following.

## 8-20. INSTALLATION CHECKOUT.

8-21. TESTING OF LINES. When the installation is complete and before the units are installed in their case, all wiring lines should be checked for continuity, ground, and accuracy of connection in accordance with the installation wiring diagram.

## WARNING

Be sure the power switch has been turned off and fuses have been removed at the IC switchboard.

8-22. REPLACING FRONT PANEL CHASSIS ASSEMBLY. Replace this assembly in the case before proceeding with further tests. Reverse the operations

outlined in paragraph 8-12 Care should be taken to apply equal pressure to the upper portion of each handle so that the connector guides align squarely and permit smooth engagement of the corresponding plugs and receptacles. As soon as the gasket of the panel comes to rest on the case, tighten the four assembly bolts at the corners with equal force so that the gasket will be compressed uniformly all around.

8-23. OPERATIONAL CHECKS. Upon completion of installation, perform the operational checks described in paragraph 4-5.

## 8-24. STATION DESIGNATION STRIP.

$8-25$. This is an edge-lite plastic illuminated type designation strip (item 25 on figure 7-1 or item 26 on figure 7-2). It is removed from its recess in the panel for engraving by

Figure 8-5. Installation Wiring Diagram, Master Station and LS-458/SIC.

Figure 8-6. Installation Wiring Diagram, Parallel Operation of Master Stations
removing the lens caps from the sockets (item 6 on figure 7-1 or item item 7 on figure 7-2). Guide lines are already lightly engraved on the strip to enable centering of the subsequent designation engraving between the guide lines under the selector pushbuttons.

## 8-26. SYSTEM VARIATIONS.

8-27. Certain variations of intercommunication systems, utilizing equipment which is not described in this manual, are feasible. Refer to figures 8-5 8-6, 8-7 and $8-8$ for the necessary interconnection wiring for these variations. If additional information, regarding the operation and functional descriptions of the LS-458/ SIC or LS-386/SIC and Remote Loudspeakers is necessary, refer to Technical Manuals NAVSHIPS 0965-079-7010, NAVSHIPS 365-2750, and NAVSHIPS 3652739.

Change $1 \quad 8-17$

Figure 8-7. Installation Wiring Diagram, Master Station and Remote Loudspeaker.

## NOTES:

1). These instructions provide capability for hands free reply from LS518A/SIC or LS-519A/SIC intercom unit (called station) when calling station is an LS-385/SIC or LS-386/ SIC unit. In systems which have all types of intercoms only LS-518A/SIC or LS-519A/SIC units can reply hands free. LS-385/SIC and LS-386/SIC units can not reply hands free.
2). General: Description of Instructions. These instructions consist of internal wiring changes to type LS-385/SIC or LS-386/SIC intercom units. When the change is completed the modified unit can control talk/listen switching of any LS-518A/SIC or LS-519A/SIC unit in the system when the called station is in the hands free mode.

## NOTE

## This modification can not be applied to LS-385/SIC or LS386/SIC units which are connected for parallel operation.

3). Instructions: Control of talk/listen switching of called station is provided by spare contacts 5 and 6 on LS-385/SIC or LS-386/SIC talk relay K1. The relay contacts are connected in parallel with a 330 ohm resistor. Since terminal 1X of the called station is connected to signal circuit common through this parallel combination, the necessary control is provided for hands free operation of the called station.

1. Remove the P1-P2, (P3) connector bracket(s) at rear of unit to expose pushbutton switches wiring.

## 2A. LS-386 Units

Locate the wire from connector P1 pin 7 at switch S1 terminal 1; wire usually wht/blk. Disconnect this wire at switch S1. Using ohmmeter check for continuity from wire removed at switch S1 step 2A, and connect P1 pin 7. Switch S1 terminal 1, leave other wire connected; wire usually blk/wht, from resistor R19

2B. LS-385 Units
Locate the wire from connector P1 pin 7 at switch S22 terminal 1. Wire usually wht/blk. Disconnect this wire at switch S22. Using ohmmeter check for continuity from wire removed at switch S22 step 2B and connector P1 pin 7. Switch S22 terminal 1, leave other wire connected; wire usually blk/wht, from resistor R19.

3A. LS-386 Units
Locate the wire from switch S23 terminal 1 N/C at switch S1 terminal 3 or 6. Wire usually blk. Disconnect wire at switch S1. Using an ohmmeter check for continuity from wire removed at switch S1 step 3A and switch S23 terminal 1 $\mathrm{N} / \mathrm{C}$. Switch S1 terminal 3 or 6 , leave other wire connected; wire usually wht.

3B. LS-385 Units
Locate the wire from switch S24 terminal $1 \mathrm{~N} / \mathrm{C}$ at switch S22 terminal 3 or 6. Wire usually blk. Disconnect wire at switch S22. Using an ohmmeter check for continuity from wire removed at switch S22 step 3B and switch S24 terminal $1 \mathrm{~N} / \mathrm{C}$. Switch S22 terminal 3 or 6 , leave other wire connected; wire usually wht.
4. Slip about 2 inches of 16 gauge teflon sleeving on the wht/blk wire removed in step 2A or 2B.
5. Splice the wht/blk and blk wires removed in either steps $2 \mathrm{~A}, 3 \mathrm{~A}$, or $2 \mathrm{~B}, 3 \mathrm{~B}$ together. Slip sleeving, step 4, over splice to insulate.
6. On the terminal board located in the back of the case, remove jumper wires Y 1 to Y 2 and Y 3 to Y 4 .
7. On terminal board located in the back of case, connect a 330 1/2W resistor from terminal MCXX to S 1 ; add jumper wire S 1 to Y 2 , MCXX to $\mathrm{Y} 3, \mathrm{Y} 1$ to Y4.

Final Checks

1. Install the modified unit in a system containing an LS-518A (LS-519A).
2. Select and call the LS-518A station and request that the operator place his PTT switch in the HANDS FREE position.
3. The "calling" station should now receive sound from the called station.
4. Depressing the PTT switch on the calling station should now permit transmitting to the called station.
5. Repeat steps 2 through 4 for remaining LS-518A and LS-519A units in circuit.

## APPENDIX B <br> MAINTENANCE ALLOCATION

## SECTION I. INTRODUCTION

## 1. General.

This appendix provides a summary of the maintenance operations for Intercommunication Stations LS$518 \mathrm{~A} /$ SIC and LS-519A/SIC. It authorizes categories of maintenance for specific maintenance functions on repairable items and components and the tools and equipment required to perform each function. This appendix may be used as an aid in planning maintenance operations.

## 2. Maintenance Function.

Maintenance functions will be limited to and defined as follows:
a. Inspect. To determine the serviceability of an item by comparing its physical, mechanical, and/or electrical characteristics with established standards through examination.
b. Test. To verify serviceability and to detect incipient failure by measuring the mechanical or electrical characteristics of an item and comparing those characteristics with prescribed standards.
c. Service. Operations required periodically to keep an item in proper operating condition, i.e., to clean (decontaminate), to preserve, to drain, to paint, or to replenish fuel, lubricants, hydraulic fluids, or compressed air supplies.
d. Adjust. To maintain, within prescribed limits, by bringing into proper or exact position, or by
setting the operating characteristics to the specified parameters.
e. Align. To adjust specified variable elements of an item to bring about optimum or desired performance.
f. Calibrate. To determine and cause corrections to be made or to be adjusted on instruments or test measuring and diagnostic equipments used in precision measurement. Consists of comparisons of two instruments, one of which is a certified standard of known accuracy, to detect and adjust any discrepancy in the accuracy of the instrument being compared.
g. Install. The act of emplacing, seating, or fixing into position an item, part, module (component or assembly) in a manner to allow the proper functioning of the equipment or system.
h. Replace. The act of substituting a serviceable like type part, subassembly, or module (component or assembly) for an unserviceable counterpart.
i. Repair. The application of maintenance services (inspect, test, service, adjust, align, calibrate, replace) or other maintenance actions (welding, grinding, riveting, straightening, facing, remachining, or resurfacing) to restore serviceability to an item by correcting specific damage, fault, malfunction, or failure in a part, subassembly, module (component or assembly), end item, or system.
j. Overhaul. That maintenance effort (service/action) necessary to restore an item to a completely serviceable/operational condition as prescribed by maintenance standards (i.e., DMWR) in appropriate technical publications. Overhaul is normally the highest degree of maintenance performed by the Army. Overhaul does not normally return an item to like new condition.
I. Rebuild. Consists of those services/actions necessary for the restoration of unserviceable equipment to a like new condition in accordance with original manufacturing standards. Rebuild is the highest degree of material maintenance applied to Army equipment. The rebuild operation includes the act of returning to zero those age measurements (hours, miles, etc.) considered in classifying Army equipments/components.

## 3. Column Entries.

a. Column 1, Group Number. Column 1 lists group numbers, the purpose of which is to identify components, assemblies, subassemblies, and modules with the next higher assembly.
b. Column 1, Component/Assembly. Column 2 contains the noun names of components, assemblies, subassemblies, and modules for which maintenance is authorized.
c. Column 3, Maintenance Functions. Column 3 lists the functions to be performed on the item listed in column 2. When items are listed without maintenance functions, it is solely for purpose of having the group numbers in the MAC and RPSTL coincide.
d. Column 4, Maintenance Category. Column 4 specifies, by the listing of a "worktime" figure in the appropriate subcolumn(s), the lowest level of maintenance authorized to perform the function listed in column 3. This figure represents the active time required to perform that maintenance function at the indicated category of maintenance. If the number or complexity of the tasks within the listed maintenance function vary at different maintenance categories, appropriate "worktime" figures will be shown for each category. The number of task-hours specified by the "worktime" figures represents the average time required to restore an item (assembly, subassembly, component, module, end item or system) to a serviceable condition under typical field operating conditions. This time includes preparation time, troubleshooting time, and quality assurance/quality control time in addition to the time required to perform the specific tasks identified for the maintenance functions authorized in the maintenance allocation chart. Subcolumns of column 4 are as follows:

C Operator/Crew
O Organizational
F Direct Support
H General Support
D Depot
e. Column 5, Tools and Equipment. Column 5 specifies by code, those common tool sets, (not individual tools) and special tools, test, and support equipment required to perform the designated function.
f. Column 6, Remarks. Column 6 contains an alphabetic code which leads to the remark in Section IV, Remarks, which is pertinent to the item opposite the particular code.

## 4. Tool and Test Equipment Requirements (Section

 III).a. Tool or Test Equipment Reference Code. The numbers in this column coincide with the numbers used in the tools and equipment column of the MAC. The numbers indicate the applicable tool or test equipment for the maintenance functions.
b. Maintenance Category. The codes in this column indicate the maintenance category allocated the tool or test equipment.
c. Nomenclature. This column lists the noun name and nomenclature of the tools and test equipment required to perform the maintenance functions.
d. National/NATO Stock Number. This column lists the National/NATO stock number of the specific tool or test equipment.
e. Tool Number. This column lists the manufacturer's part number of the tool followed by the Federal Supply Code for manufacturers (5-digit) in parenthesis.

## 5. Remarks (Section IV).

a. Reference Code. This code refers to the appropriate item in Section II, Column 6.
b. Remarks. This column provides the required explanatory information necessary to clarify items appearing in Section II.
